

# ABM ENGINE

## COMPLETE BUSINESS LOGIC BIBLE V3

All 231 Rules — Full Explanations — Section 1 Complete

Decimal Technologies | KSA Banking & Financial Institutions

Date: June 11, 2026

Version: 3.0 — Deep 5-Whys Excavation

Scope: Section 1 — Foundational Philosophy (Principles 1 & 2)

### WHAT THIS DOCUMENT CONTAINS

Every business rule discovered through the 5-Whys deep analysis of Section 1.

Principle 1: Event-Driven Architecture — 92 rules

Principle 2: Enterprise Decision System Architecture — 139 rules

Total: 231 rules with complete explanations, rationale, and decision logic.

This is the SINGLE SOURCE OF TRUTH for the ABM engine's business logic.

# TABLE OF CONTENTS

---

## PRINCIPLE 1 — EVENT-DRIVEN ARCHITECTURE (92 rules)

- 1A. Core 5-Whys Analysis (23 rules)
- 1B. Failure Mode 1: No Signals Detected (7 rules)
- 1C. Failure Mode 2: False Signals (5 rules)
- 1D. Failure Mode 3: Signal Detected Too Late (6 rules)
- 1E. Failure Mode 4: Signal Without Buying Intent (5 rules)
- 1F. Failure Mode 5: Signal Overload (6 rules)
- 1G. Failure Mode 6: Signal Manipulation (4 rules)
- 1H. Failure Mode 7: Dark Intent (5 rules)
- 1I. Failure Mode 8: Signal Conflict (4 rules)
- 1J. Failure Mode 9: Survivorship Bias (4 rules)
- 1K. Failure Mode 10: Human Bottleneck (5 rules)
- 1L. Module 0: Intelligence Governance Engine (11 rules + 7 ICS sub-rules)

## PRINCIPLE 2 — ENTERPRISE DECISION SYSTEM ARCHITECTURE (139 rules)

- 2A. Core 5-Whys & Account Coordination (6 rules)
- 2B. Human-AI Review Logic (4 rules)
- 2C. Timing Windows & Volume Controls (6 rules)
- 2D. Reasoning Chain Rules (4 rules)
- 2E. Account Identity & Boundaries (7 rules)
- 2F. Buying Committee Model (6 rules)
- 2G. Failure Mode A: Misattribution (4 rules)
- 2H. Failure Mode B: Scope Creep (3 rules)
- 2I. Failure Mode C: Owner Dependency (3 rules)
- 2J. Failure Mode D: Account Fatigue (4 rules)
- 2K. Failure Mode E: Data Decay (3 rules)
- 2L. Reply-Based Pause Logic (4 rules)
- 2M. Business Law Exceptions (12 rules)
- 2N. Three-Score Architecture (2 rules)
- 2O. Layer 1: Consensus Formation (5 rules)
- 2P. Layer 2: Champion Strength (4 rules)
- 2Q. Layer 3: Anti-Champion Detection (4 rules)
- 2R. Layer 4: Political Power Map (4 rules)
- 2S. Layer 5: Buying Journey Stage (4 rules)
- 2T. Layer 6: Budget Architecture (5 rules)
- 2U. Layer 7: Initiative Criticality (3 rules)
- 2V. Layer 8: Project Maturity (3 rules)
- 2W. Layer 9: Internal Urgency (3 rules)

2X. Layer 10: Vendor Lock-In (3 rules)  
2Y. Layer 11: Procurement Readiness (2 rules)  
2Z. Layer 12: Relationship Network Graph (3 rules)  
2AA. Layer 13: Organizational Stability (2 rules)  
2AB. Layer 14: Consensus Momentum (3 rules)  
2AC. Layer 15: Opportunity Death Prediction (3 rules)  
2AD. Trend & Prediction (2 rules)  
2AE. Competitive Intelligence (4 rules)  
2AF. Reference Effect (3 rules)  
2AG. Portfolio Strategy (3 rules)  
2AH. Market Position (1 rule)  
2AI. Account Network Effects (3 rules)  
2AJ. Customer Intelligence (3 rules)  
2AK. Expansion Intelligence (2 rules)  
2AL. Loss Intelligence (3 rules)  
2AM. Temporal Patterns (3 rules)  
2AN. Deal Velocity (3 rules)

# PRINCIPLE 1 — EVENT-DRIVEN ARCHITECTURE

Nothing happens without a trigger. Every workflow, every score update, every outreach decision is triggered by an event. The system watches the world and reacts. This section contains all 92 rules governing how the event-driven model works, where it breaks, and how it self-monitors.

## 1A. Core 5-Whys Analysis (23 Rules)

### Event Response Timing

#### NEW RULE [EVENT-RESP-001]

"Immediate" for P1 signals means scoring recalculation must BEGIN within 15 minutes of signal ingestion. For P2, within 1 hour. The entire cascade (scoring, tier check, enrichment trigger) must complete within 2 hours for P1 and 6 hours for P2. WHY: P1 signals have a golden window. A new CTO spends weeks 1-4 evaluating the landscape. 15 minutes is fast enough to stay same-day. 1 hour for P2 is sufficient for strategic-but-not-urgent signals.

#### NEW RULE [EVENT-RESP-002]

Signal ingestion and scoring run 24/7/365 regardless of business hours. Only OUTREACH EXECUTION respects business hours and KSA weekends. WHY: A P1 signal at 11pm Thursday should have score updated, enrichment triggered, AI reasoning complete, and message drafted by Friday morning, ready to send Sunday 9am.

#### NEW RULE [EVENT-RESP-003]

The system maintains a "Ready-to-Fire Queue" for messages that have passed AI QC and await either human review or next valid send window. Queue ordered by signal priority (P1 first) then signal age (oldest first within same priority). WHY: Ensures highest-priority messages send first when business hours resume.

#### NEW RULE [EVENT-RESP-004]

Every event carries a "trace\_id" linking the original trigger through every downstream action: signal, scoring record, enrichment record, AI generation, message, and engagement. WHY: If anyone asks "why did this person receive this message?" the trace\_id answers in one lookup. Full audit trail.

### Account Coordination

#### NEW RULE [ACCT-COORD-001]

When outreaching to multiple contacts at the same account, stagger initial touches by minimum 48 hours between contacts. Contact #1 Day 1, Contact #2 Day 3, Contact #3 Day 5. WHY: Prevents the "everyone got emailed on the same day" problem that signals mass outreach rather than strategic engagement.

#### NEW RULE [ACCT-COORD-002]

Maximum 3 contacts per account in active outreach simultaneously during MVP. WHY: More than 3 creates coordination complexity and increases conflicting message risk.

#### NEW RULE [ACCT-COORD-003]

Contact outreach priority order: (1) Role most directly mapping to Decimal's value (CTO, CDO, Head of Digital), (2) Most senior reachable contact, (3) Warmest existing relationship, (4) Verified email over LinkedIn-only. WHY: Role relevance predicts response rate better than seniority alone.

#### NEW RULE [ACCT-COORD-004]

Conflicting signals at the same account are flagged as "SIGNAL\_CONFLICT." The system does NOT auto-resolve. Both signals are presented to the human reviewer. AI can suggest resolution but cannot execute autonomously. WHY: Conflicting intelligence requires strategic judgment humans are better at.

#### NEW RULE [ACCT-COORD-005]

Accounts can be linked as "related\_accounts" with relationship type: PARENT\_SUBSIDIARY, PARTNER, SHARED\_BOARD, SAME\_GROUP. When one account in a group reaches OUTREACH\_ACTIVE, alert account\_owner to manually coordinate. WHY: Related accounts often have overlapping stakeholders — uncoordinated outreach across group entities looks uncoordinated.

#### NEW RULE [ACCT-COORD-006]

A contact appearing at TWO related accounts gets a "primary\_account" designation. Outreach ONLY through their primary account. WHY: Receiving outreach from two "different" Decimal campaigns simultaneously destroys credibility.

## Human-AI Review Logic

### NEW RULE [HUMAN-AUTO-001]

Three-phase human review reduction: Phase 1 (Days 0-90): 100% human review. Phase 2 (91-180): Optional for P3/P4 + non-C-suite if QC rate >85% and override <10%. Phase 3 (181+): Optional for P2 + Director-level if QC >92% and override <5%. C-suite messages: ALWAYS human reviewed, permanently. WHY: C-suite errors are reputation-destroying. Lower-risk messages can be automated once trust is established.

### NEW RULE [HUMAN-AUTO-002]

Escalation chain for message review: Hour 0-4: Primary reviewer (account\_owner). Hour 4-8: Backup reviewer (buddy). Hour 8-24: Team lead. Hour 24+: Message expires, must be regenerated with fresh context. WHY: Context goes stale. "This week's announcement" becomes last week's after 48 hours.

### NEW RULE [HUMAN-AUTO-003]

Track edit distance on human edits: MINOR\_TWEAK <15%, SIGNIFICANT\_EDIT 15-50%, MAJOR\_REWRITE >50%. If MAJOR\_REWRITE rate exceeds 30% for a signal\_type or persona\_type, trigger prompt optimization review. WHY: High rewrite rates mean the AI is failing for that category — fix the prompts, not the individual messages.

### NEW RULE [HUMAN-AUTO-004]

Human-added factual claims must be logged separately from AI-generated claims. WHY: The system validates AI claims against enrichment data. Human additions are not validated but must be tracked for audit purposes.

## Timing Windows & Volume Controls

### NEW RULE [TIMING-WIN-001]

Each signal type has a "Golden Window" — the period where outreach has maximum impact: LEADERSHIP\_HIRE: Days 7-30. REGULATORY: Days 1-14. DIGITAL\_INITIATIVE: Days 1-21. FUNDING: Days 14-45. HIRING\_SURGE: Days 1-30. WHY: Each event type has a natural lifecycle. Too early = premature. Too late = the window closed.

### NEW RULE [TIMING-WIN-002]

If a message cannot be sent within the Golden Window (stuck in review, holiday delay), it must be REGENERATED with updated framing. WHY: A message saying "your recent announcement" 40 days later is embarrassing.

### NEW RULE [TIMING-VOL-001]

The 5-accounts/day outreach limit is based on: (a) human review capacity (~10-15 messages/day), (b) email deliverability (new domain warmup), (c) MVP quality assurance. Review monthly. Increase by 2/day/month up to max 15/day. WHY: Gradual scaling prevents quality collapse and deliverability damage.

### NEW RULE [TIMING-VOL-002]

When >5 accounts qualify for outreach on the same day, rank by: (1) Signal priority P1 first, (2) Account score highest first, (3) Relationship warmth warmest first. Top 5 enter outreach. Remainder go to PRIORITY\_QUEUE, max 3 business days wait. WHY: Prioritization ensures best opportunities get served first.

### NEW RULE [TIMING-VOL-003]

P1 Golden Window expiry OVERRIDES daily volume cap via "EMERGENCY\_SLOT" — up to 2 emergency slots/day on top of regular 5. P2/P3/P4 do not get emergency slots. Max total: 7 accounts/day. WHY: Missing a P1 Golden Window is a higher cost than slightly exceeding volume limits.

## AI Reasoning Chain

### NEW RULE [REASON-CHAIN-001]

Each AI agent's output goes through mini-validation before passing to the next: (a) non-empty, (b) expected format, (c) length within bounds, (d) no obvious errors (wrong company name). Fail = retry that agent once. Second fail = CHAIN\_BROKEN, route to manual. WHY: Bad output cascading through the chain produces compounding errors.

### NEW RULE [REASON-CHAIN-002]

Agents 5 (Strategy) and 7 (QC) have access to ORIGINAL source data (signals, enrichment), not just prior agents' outputs. WHY: Cross-checking prevents telephone-game drift where each agent's interpretation moves further from reality.

#### **NEW RULE [REASON-CHAIN-003]**

Minimum data to start the reasoning chain: Required: 1+ non-expired signal, 1+ contact with email or LinkedIn, company name + segment + country. Desired: AI summary, 3+ contacts, digital maturity score. Missing "Required" = chain blocked. Missing "Desired" = chain proceeds with conservative fact-only messaging. WHY: Insufficient data produces hallucination-prone output.

#### **NEW RULE [REASON-CHAIN-004]**

Target chain completion: under 5 minutes per contact. SLA: under 10 minutes. >10 min = log as SLOW\_CHAIN with bottleneck agent. If primary model causes >20% slow chains, evaluate faster model for non-critical agents. WHY: Speed matters for Golden Window compliance.

## 1B. Failure Mode 1: No Signals Detected (7 Rules)

When no signals come in, the entire system starves. No signals = no scoring = no enrichment = no outreach = zero pipeline.

### NEW RULE [FAIL-SILENT-001]

"Signal Health Score" per source. Track: last\_successful\_poll, signals\_returned\_count, error\_count, consecutive\_zero\_result\_polls. If any source returns zero results for 3 consecutive poll cycles, trigger alert: "SOURCE\_POSSIBLY\_DOWN." WHY: The system cannot distinguish between "no news today" and "our connection is broken" without monitoring.

### NEW RULE [FAIL-SILENT-002]

Baseline signal volume thresholds: Google News: zero signals for 24h = alert. SAMA RSS: zero for 7 days = alert. LinkedIn: zero for 48h = alert. Overall: total signals <50% of 7-day average for 2 consecutive days = "SIGNAL\_DROUGHT" alert. WHY: Each source has different natural frequency. Thresholds must be source-specific.

### NEW RULE [FAIL-SILENT-003]

Every poll cycle must log: source, start\_time, end\_time, http\_status, signals\_found, errors. Even "zero results" is a valid log. Missing log = poll didn't run (different failure). WHY: Distinguishes "polled and found nothing" from "poll never executed."

### NEW RULE [FAIL-SILENT-004]

"Stagnation Detection" — If a HIGH-FIT account (Static Fit Score  $\geq 60$ ) has been WATCHING with zero signals for 45 days, flag as "SIGNAL\_DARK\_ACCOUNT" for weekly human review. Human can: (a) manually research, (b) broaden keywords, (c) accept silence, (d) force-promote. WHY: Good accounts can go quiet. The system must surface them rather than letting them rot.

### NEW RULE [FAIL-SILENT-005]

Every account has TWO scores: (1) DYNAMIC SCORE (0-100) — signal-driven, changes with events, drives tier assignment. (2) STATIC FIT SCORE (0-100) — ICP match regardless of signals. Calculated from: segment fit, size fit, geography fit, technology gap, regulatory exposure. Set at account creation, updated during enrichment. WHY: Intent (dynamic) and fit (static) are orthogonal. A perfect-fit account with no signals is still worth monitoring.

### NEW RULE [FAIL-SILENT-006]

Static Fit Score governs: (a) account entry threshold (only Fit  $\geq 40$  enters system), (b) tie-breaking priority, (c) stagnation detection threshold (only  $\geq 60$ ), (d) enrichment depth (Fit  $\geq 80$  gets FULL enrichment even at WARM). WHY: Not all accounts deserve equal system resources. Fit determines baseline investment.

### NEW RULE [FAIL-SILENT-007]

"Proactive Signal Generation" — For SIGNAL\_DARK accounts with Static Fit  $\geq 70$ , weekly expanded search: company name + "technology"/"digital"/"innovation", LinkedIn company page posts, job board scraping. WHY: Standard polling may miss signals that broader searches catch. Weekly frequency avoids API overuse.

## 1C. Failure Mode 2: False Signals (5 Rules)

The system detects a signal that LOOKS like buying intent but isn't. Example: 'Digital transformation' article about an ATM upgrade, not a platform overhaul.

### NEW RULE [FAIL-FALSE-001]

Two-stage signal classification: Stage 1 — Keyword Detection (automated, catches potential signals). Stage 2 — Contextual Validation (AI reads full content and answers: "Does this indicate technology evaluation in categories Decimal serves?") Output: YES (proceed), MAYBE (proceed, confidence -0.2), NO (discard with log). Both stages must pass. WHY: Keywords match context-free. AI validates actual meaning.

### NEW RULE [FAIL-FALSE-002]

Confidence score thresholds: 0.8-1.0 HIGH: full processing. 0.6-0.79 MODERATE: full processing, flag VERIFY\_IF\_POSSIBLE. 0.4-0.59 LOW: scoring only (reduced weight), NOT primary outreach trigger. 0.0-0.39 INSUFFICIENT: store for history, exclude from scoring. WHY: Different confidence levels require different treatment.

### NEW RULE [FAIL-FALSE-003]

"Signal Retraction" workflow: A signal can be marked FALSE\_POSITIVE by a human at any time. When retracted: (1) mark is\_false\_positive, (2) recalculate score without it, (3) if tier drops, downgrade, (4) if outreach was active, flag for human review, (5) if message already sent referencing this signal, prepare recovery brief for account\_owner, (6) feed into AI classifier training. WHY: False signals that trigger outreach can cause reputation damage. Recovery must be structured.

### NEW RULE [FAIL-FALSE-004]

Track "Signal Accuracy Rate" per source and signal type:  $(\text{Total} - \text{false\_positives} - \text{low\_conf}) / \text{Total}$ . Targets: >80% Google News, >90% SAMA RSS, >75% LinkedIn. Source dropping below target for 2 consecutive weeks = "SOURCE\_QUALITY\_REVIEW." Monthly report: accuracy breakdown matrix. WHY: Quantitative tracking prevents gradual quality degradation.

### NEW RULE [FAIL-FALSE-005]

"False Signal Pattern Library" — After 90 days, analyze confirmed false positives and identify patterns. Initial seed: app redesigns vs platform-level change, marketing partnerships vs tech deals, branch staff hiring vs tech hiring, sanctions/AML vs banking tech mandates, competitor press releases disguised as industry news. Patterns become negative rules in AI classifier (confidence -0.3). WHY: Systematic pattern recognition prevents repeated mistakes.

## 1D. Failure Mode 3: Signal Detected Too Late (6 Rules)

The signal was real and high-intent, but the system found it too late. The Golden Window closed. Competitors got there first.

### NEW RULE [FAIL-LATE-001]

"Time-to-Detection" metric: time between event's ACTUAL date and system's detected\_at timestamp. Target: median <24h for P1. If median >48h for P1 in any 30-day period, trigger polling frequency review and source expansion evaluation. WHY: Detection delay directly reduces outreach effectiveness.

### NEW RULE [FAIL-LATE-002]

"Manual Signal Fast Lane" — Human-entered manual signals are PRE-VALIDATED at confidence 0.9, skip AI classification Stage 2, enter scoring immediately. 24-hour processing SLA. WHY: The human IS the classifier. Manual intelligence from BD team and connectors is high-reliability and time-sensitive.

### NEW RULE [FAIL-LATE-003]

"Signal Source Expansion Roadmap" — Maintain prioritized backlog of new sources. MVP: Google News, SAMA, LinkedIn, Funding DBs, Manual. Phase 2: Job boards (Bayt.com), Saudi Gazette, Arab News, fintech publications, conference lists. Phase 3: Etimad tenders, App Store reviews, Glassdoor. Each evaluated on: unique signal coverage, false positive rate, API cost, implementation effort. WHY: No single source catches everything. Systematic expansion reduces blind spots.

### NEW RULE [FAIL-LATE-004]

"End-to-End Pipeline SLA" — Total elapsed time from signal detection to message sent: P1 target <= 24h to review queue, <= 48h to sent. P2: <= 48h to queue, <= 72h to sent. P3: <= 5 business days. P4: no SLA. Weekly bottleneck report. WHY: Each stage adds latency. Without end-to-end SLA, no one owns the total delay.

### NEW RULE [FAIL-LATE-005]

"Emergency Enrichment" for P1 signals on accounts with no existing contacts: Abbreviated 3-step process: (1) find top 2 contacts by seniority via Apollo, (2) verify emails, (3) generate minimal account summary. Target: under 2 hours. Full enrichment runs in background. WHY: P1 signals on unenriched accounts would otherwise lose their Golden Window waiting for full 7-step enrichment.

### NEW RULE [FAIL-LATE-006]

"Stale Signal Outreach Decision" — If signal detected AFTER Golden Window closed: P1: still process, but AI must NOT reference as "recent" — frame as ongoing initiative. P2: process only if another FRESH signal exists. P3/P4: context only, no outreach trigger. WHY: Late detection doesn't invalidate the signal, but messaging must be reframed to avoid looking out of touch.

## 1E. Failure Mode 4: Signal Without Buying Intent (5 Rules)

The signal is real and timely, but doesn't actually indicate technology procurement. 'Record profits' doesn't mean they're buying a lending platform.

### NEW RULE [FAIL-INTENT-001]

Signals classified on TWO dimensions: RELEVANCE (P1-P4, already exists) and INTENT: ACTIVE\_PROCUREMENT (direct vendor evaluation evidence), BUILDING (internal tech build evidence), STRATEGIC\_SHIFT (change preceding procurement), CONTEXTUAL (relevant info, no procurement intent). Only ACTIVE\_PROCUREMENT and BUILDING can be P1. CONTEXTUAL is P3/P4 max. WHY: Priority without intent creates false urgency.

### NEW RULE [FAIL-INTENT-002]

Intent-based scoring multiplier: ACTIVE\_PROCUREMENT x1.5, BUILDING x1.2, STRATEGIC\_SHIFT x1.0, CONTEXTUAL x0.5. A P2 ACTIVE\_PROCUREMENT signal ( $25 \times 1.5 = 37.5$  pts) scores HIGHER than a P1 CONTEXTUAL ( $40 \times 0.5 = 20$  pts). WHY: Intent quality matters more than signal category.

### NEW RULE [FAIL-INTENT-003]

"Account-Relative Intent" — Same signal gets different intent based on account readiness. Open banking mandate: account readiness 1-3 = ACTIVE\_PROCUREMENT (must buy). Readiness 4-6 = BUILDING. Readiness 7-10 = CONTEXTUAL (already compliant). If readiness unknown, default to STRATEGIC\_SHIFT. WHY: Same regulation creates different urgency depending on the bank's current capabilities.

### NEW RULE [FAIL-INTENT-004]

"Intent-to-Conversion Analysis" every 90 days: for each intent level, what % led to meetings? Expected: ACTIVE\_PROCUREMENT > BUILDING > STRATEGIC\_SHIFT > CONTEXTUAL. If CONTEXTUAL converts within 50% of STRATEGIC\_SHIFT, classification is too generous — recalibrate. WHY: Intent labels must map to real-world outcomes or they're meaningless.

### NEW RULE [FAIL-INTENT-005]

"Signal Accumulation Rule" — 3+ CONTEXTUAL signals for same account within 30 days = auto-upgrade ONE to STRATEGIC\_SHIFT. WHY: Multiple contextual signals (profits + hires + conference + press) in short window suggest expansionary phase. Individually none implies buying. Together they suggest growth investment. Cap: once per 30-day window.

## 1F. Failure Mode 5: Signal Overload (6 Rules)

Too many signals. 20 accounts score HOT. Daily cap is 5-7. Human reviewer has 50 messages. Everything is urgent. Nothing gets attention.

### NEW RULE [FAIL-OVERLOAD-001]

"Surge Detection" — If P1+P2 signals in any 24h window exceed 3x the trailing 7-day daily average, declare "SIGNAL\_SURGE": (a) increase daily cap from 5 to 10, (b) assign second reviewer, (c) log surge event, (d) revert when volume <1.5x average for 3 days. WHY: SAMA regulatory announcements can trigger 15+ accounts simultaneously.

### NEW RULE [FAIL-OVERLOAD-002]

"Surge Prioritization Stack Rank" — When more HOT accounts than capacity: Rank 1: ACTIVE\_PROCUREMENT intent. Rank 2: relationship\_warmth >= WARM. Rank 3: highest Static Fit. Rank 4: highest Dynamic Score. Rank 5: earliest Golden Window expiry. Serve top of stack until capacity reached. WHY: Not all HOT accounts are equally likely to convert.

### NEW RULE [FAIL-OVERLOAD-003]

"Reviewer Load Balancing" — Max 20 messages/reviewer/day. Beyond this, quality degrades. Queue exceeds (reviewers x 20) = "REVIEWER\_OVERLOAD" alert. Options: activate backup, extend P3/P4 SLA from 4h to 8h, auto-approve P3/P4 if Phase 2+ automation active. P1/P2 and C-suite: NEVER skip human review. WHY: Reviewer fatigue produces approval rubber-stamping.

### NEW RULE [FAIL-OVERLOAD-004]

"Surge Differentiation Rule" — When 5+ accounts triggered by SAME signal: AI receives explicit instruction to differentiate. QC Agent checks: "Does this message contain at least 2 sentences specific to THIS account?" Fail = regenerate with stronger account-specific context. WHY: 15 banks getting the same SAMA-triggered message with only the name changed looks like mass marketing.

### NEW RULE [FAIL-OVERLOAD-005]

"Capacity State Machine" — System operates in: NORMAL (standard caps), SURGE (elevated caps, triggered by FAIL-OVERLOAD-001), DROUGHT (expanded signal search, triggered when signals <30% of 7-day average for 3+ days). Transitions logged. Cannot be in two states. SURGE->NORMAL requires 3 days sub-threshold. WHY: Different operating modes require different system configurations.

### NEW RULE [FAIL-OVERLOAD-006]

"Surge Retrospective" — Within 7 days of surge ending: How many accounts served vs queued? Average queue wait time? Golden Windows missed? Reviewer turnaround? Were surge-period messages lower quality (lower reply rate)? WHY: Post-surge analysis feeds capacity planning improvements.

## 1G. Failure Mode 6: Signal Manipulation (4 Rules)

Companies publish fake signals. A CEO's conference speech about 'digital transformation' may be PR with no budget, no project, no real initiative. Public relations is not buying intent.

### NEW RULE [FAIL-MANIP-001]

"Observability Score" — Every signal gets evidence-based corroboration assessment: Press release ONLY = 30. Press + hiring = 60. Press + hiring + leadership hire = 80. Press + hiring + leader + RFP = 95. Job postings WITHOUT press release = 70 (stealth build, often more genuine). SAMA mandate + bank below compliance = 90. Conference presentation only = 25. WHY: Single-source PR is unreliable. Corroborating evidence from independent sources validates intent.

### NEW RULE [FAIL-MANIP-002]

If average Observability Score across active signals <40, ICS Verification dimension is capped at 30 regardless of email verification quality. WHY: Verified email to the right person is worthless if the REASON for reaching out (the signal) is unverifiable PR.

### NEW RULE [FAIL-MANIP-003]

"Signal Maturation Tracking" — Low-observability signals ( $\leq 40$ ) enter "WATCH\_FOR\_CORROBORATION" state. If corroborating signal from different source arrives within 60 days: upgrade observability to average of both, recalculate ICS, log maturation. WHY: The system doesn't reject PR signals. It withholds judgment and waits for evidence.

### NEW RULE [FAIL-MANIP-004]

"Account Credibility Index" (after 12 months of data) — Track whether signals at each account lead to actual activity: (Signals leading to verified activity within 6mo) / (Total signals). Credibility  $\geq 70\%$ : +0.1 confidence bonus. 40-69%: neutral.  $<40\%$ : -0.15 confidence penalty — "this bank talks more than it acts." WHY: Some organizations are chronic PR-without-substance offenders.

## 1H. Failure Mode 7: Dark Intent — Buying Without Signals (5 Rules)

The most dangerous blind spot. A bank internally approved \$5M for lending modernization. Nothing public. System sees intent = 0. Reality: intent = 100.

### NEW RULE [FAIL-DARK-001]

"Dark Intent Detection Framework" — 4 source categories: (1) Relationship Intelligence: manual entry by BD, confidence 0.80 (anonymous tips 0.50). (2) Conference Intelligence: manual with event/speaker/quote, confidence 0.75 (specific quotes 0.90). (3) Ecosystem/Subsidiary Signals: automated detection + manual linkage, confidence 0.65. (4) First-Party Behavioral: website analytics from identified contacts, confidence 0.70 (anonymous 0.40). WHY: Dark intent can only be detected through human networks and behavioral signals, not public news.

### NEW RULE [FAIL-DARK-002]

Relationship intelligence gets FULL scoring weight (same as P1 ACTIVE PROCUREMENT) BUT caps ICS Verification at 50 unless corroborating public signal arrives within 30 days. WHY: Connector who says "they're buying" is usually right, but we can't independently verify a private conversation. High priority, moderate confidence.

### NEW RULE [FAIL-DARK-003]

"Manual Intelligence Incentive System": (a) every manual signal timestamped and attributed, (b) weekly dashboard showing entries per BD member and conversion rate, (c) attribution credit when manual signal leads to meeting within 60 days, (d) if total team entries <5/month, alert sales leadership, (e) post-conference/call Slack prompt within 24h: "Any intelligence to log?" WHY: If humans forget to log dark intent, the system is blind.

### NEW RULE [FAIL-DARK-004]

"Connector Intelligence Protocol": (a) designated Decimal relationship manager per connector org, (b) monthly structured check-in: "Any lending/origination/onboarding initiatives at your Saudi clients?", (c) connector intelligence entered as CONNECTOR:[name] source, (d) +0.10 confidence boost over standard manual signals, (e) track connector reliability over time. WHY: Connectors (ITC, Backbase, Tarabut, Geidea, KPMG, Mastercard) are Decimal's eyes inside banks.

### NEW RULE [FAIL-DARK-005]

"Post-Mortem: Lost Before We Knew" — When system discovers a bank selected a competitor for a deal never detected: log as MISSED\_OPPORTUNITY with account, competitor, category, value, how\_discovered. Root cause categories: No\_Public\_Signals / Signals\_Missed / Detected\_Not\_Acted / Relationship\_Gap. Quarterly review: how many missed? Estimated revenue lost? Most common root cause? WHY: You can't fix what you don't measure. Missed opportunities are the most expensive failures.

## 1I. Failure Mode 8: Signal Conflict (4 Rules)

Multiple signals contradict each other: New CTO hired (positive) + Competitor signed (negative) + Funding round (positive) + Layoffs (negative). Current engine has no conflict resolution.

### NEW RULE [FAIL-CONFLICT-001]

3 conflict types: DIRECT\_CONTRADICTION (same topic, opposite conclusions — most recent wins by default, flag for human verification), MIXED\_SIGNALS (both opportunity and risk simultaneously — not a contradiction, AI must reason about Decimal-specific relevance), TEMPORAL\_SHIFT (earlier signal suggested opportunity, later signal closed it — later signal takes priority). WHY: Different conflict types require different resolution strategies.

### NEW RULE [FAIL-CONFLICT-002]

"Signal Arbitration" for MIXED\_SIGNALS: Step 1: Tag each signal by Decimal product relevance (ORIGINATION/LENDING/ONBOARDING/WORKFLOW/OPEN\_BANKING/GENERAL). Step 2: If negative signal specifically names competitor winning in Decimal's category = "BLOCKED." If competitor won different category = potential complementary opportunity. Step 3: Net positive signals  $\geq 1$  in Decimal's category = proceed. Net negative = "CONFLICTED\_ACCOUNT" for human review. WHY: A competitor winning core banking doesn't block Decimal's origination play.

### NEW RULE [FAIL-CONFLICT-003]

AI reasoning chain must acknowledge ALL signals for conflicted accounts. Agent 4 (Pain) must reason about how conflicting signals create different pains. Agent 5 (Strategy) must choose angle that acknowledges complexity. Agent 7 (QC) must verify: "Does this message reflect the FULL signal picture?" Cherry-picked messaging = QC REJECTS. WHY: Pretending the competitor deal doesn't exist is worse than addressing it.

### NEW RULE [FAIL-CONFLICT-004]

"Confidence-Weighted Arbitration" — When signals conflict: positive confidence 0.9 vs negative confidence 0.4 = positive dominates, negative noted as context. Both  $\geq 0.7$  = genuine conflict, escalate to human. Both  $< 0.5$  = insufficient data, do NOT act on either. Log: resolution method, signals involved, confidence levels. WHY: Low-confidence contradictions shouldn't freeze the pipeline.

## 1J. Failure Mode 9: Survivorship Bias (4 Rules)

The feedback loop assumes: meeting = success, no meeting = failure. This is a dangerous logical fallacy. A perfectly executed outreach can fail due to budget freeze, contact on leave, or procurement delay — none of which mean the signal was bad.

### NEW RULE [FAIL-BIAS-001]

"Outcome Attribution Framework" — When sequence completes without meeting, classify into: SIGNAL\_MISS (signal was wrong), TIMING\_MISS (too early/late), CONTACT\_MISS (wrong person), MESSAGE\_MISS (right everything, message didn't resonate), DELIVERY\_MISS (never reached contact), EXTERNAL\_BLOCK (everything right, external factor prevented response), UNKNOWN. Each feeds its OWN feedback loop. SIGNAL\_MISS -> signal weights. CONTACT\_MISS -> persona targeting. MESSAGE\_MISS -> prompts. DELIVERY\_MISS -> infrastructure. EXTERNAL\_BLOCK -> NO negative feedback to any engine. WHY: Each failure type has a different cause and solution. Contaminating feedback loops produces wrong learnings.

### NEW RULE [FAIL-BIAS-002]

"Automated Outcome Inference": No opens + no LinkedIn accept = DELIVERY\_MISS or CONTACT\_MISS. Opens but no clicks/replies = MESSAGE\_MISS. Opens + clicks, no reply = EXTERNAL\_BLOCK or MESSAGE\_MISS. Negative reply "not interested" = SIGNAL\_MISS or TIMING\_MISS. "Not the right person" = CONTACT\_MISS. "Bad timing, try later" = TIMING\_MISS. Auto-reply + no follow-up = EXTERNAL\_BLOCK. Only  $\geq 0.7$  confidence classifications feed feedback loops. Lower = UNKNOWN for human review. WHY: Automated inference covers the clear cases, human review handles the ambiguous.

### NEW RULE [FAIL-BIAS-003]

"Success Attribution Honesty" — When meeting IS booked, classify WHY: SIGNAL\_DRIVEN (signal was the reason), RELATIONSHIP\_DRIVEN (warm intro was primary driver), TIMING\_LUCK (contacted during existing evaluation by coincidence), PERSISTENCE\_DRIVEN (no response to touches 1-3, responded to touch 4). WHY: Prevents the system from taking credit for luck and over-optimizing for non-causal factors.

### NEW RULE [FAIL-BIAS-004]

Revised Weight Recalibration: Only SIGNAL\_DRIVEN meetings count for signal weight adjustments. RELATIONSHIP\_DRIVEN meetings excluded from signal quality analysis. Each failure category feeds its own loop — CONTACT\_MISS -> persona targeting, MESSAGE\_MISS -> prompts, DELIVERY\_MISS -> infrastructure. Loops never contaminate each other. WHY: The key insight is that each failure type has its OWN feedback loop.

## 1K. Failure Mode 10: Human Bottleneck (5 Rules)

The system has 10+ human touchpoints. At each one, a human can become a bottleneck that delays or breaks the pipeline.

### NEW RULE [FAIL-HUMAN-001]

"Complete Human Dependency Map" — 10 touchpoints: Message Review (4h SLA), Signal Triage (24h), Stagnation Review (weekly), Conflict Resolution (48h), Handoff Response (2h), Manual Signal Entry (ongoing), QC Override (24h), Outcome Classification (monthly), Scoring Recalibration (quarterly), Surge Management (2h). Each has SLA, backup person, and documented consequence of failure. WHY: You can't manage bottlenecks you haven't mapped.

### NEW RULE [FAIL-HUMAN-002]

"Human Resilience Principles": (a) No single point of human failure — every role has a backup, (b) escalation timers on EVERY touchpoint, (c) graceful degradation — if human fails SLA, system escalates/queues/proceeds with guardrails, doesn't stop, (d) "Human Health Score" — % of SLAs met across all touchpoints weekly. Target  $\geq 85\%$ . Below 70% = operational review. WHY: The system must be designed to survive any single human failure.

### NEW RULE [FAIL-HUMAN-003]

"Reviewer Pool Architecture": Minimum 2 trained reviewers always. Training: 3 days (Day 1 = understanding AI chain, Day 2 = practicing with historical examples, Day 3 = live review with supervision). Certification: first 20 reviews audited,  $\geq 90\%$  agreement = certified. Vacation protocol: no reviewer goes on leave without backup confirmed active. WHY: Reviewer quality directly determines outreach quality.

### NEW RULE [FAIL-HUMAN-004]

"Progressive Automation Roadmap": Phase 1 (MVP): all touchpoints human. Phase 2 (months 4-6): message review optional for P3/P4 non-C-suite, signal triage auto-resolves 90%+ fuzzy match, outcome classification auto-inferred for clear cases. Phase 3 (months 7-12): message review optional for P2 Director-level if thresholds met, conflict resolution gets AI recommendation with human confirm. NEVER automated: C-suite message review, handoff response, scoring recalibration, manual signal entry. WHY: Gradual automation builds trust while reducing bottleneck risk.

### NEW RULE [FAIL-HUMAN-005]

"Bottleneck Early Warning System": Leading indicators: review queue depth  $>10$  = AMBER,  $>20$  = RED + activate backup. Average review time trending 50%+ above 30-day average = reviewer fatigued. Reviewer no reviews in 6+ hours during business hours = availability check. Manual signal entries declining 2+ months = intelligence flow drying up. Lagging indicators: messages expired from queue, Golden Windows missed, handoff SLA breaches. WHY: Detecting bottlenecks early prevents pipeline stalls.

## 1L. Module 0: Intelligence Governance Engine (11 Rules)

Module 0 sits ABOVE all other modules. Every other module asks 'What should we DO?' Module 0 asks 'Can we TRUST what we think we know?' This is the meta-layer that prevents the system from acting confidently on bad intelligence.

### Core Governance Rules

#### NEW RULE [GOV-001]

Intelligence Confidence Score (ICS) gates system behavior: ICS  $\geq 70$  (HIGH): normal operations. ICS 40-69 (MODERATE): tier capped at WARM regardless of Dynamic Score, outreach requires human intelligence review, AI must caveat data gaps. ICS  $< 40$  (LOW): investigate-only mode, no outreach, no tier promotion beyond COLD, enrichment is the only allowed action. Account appears on "LOW CONFIDENCE / HIGH FIT" investigation list if Static Fit  $\geq 60$ . WHY: A score of 85 built on 1 unverified signal is radically different from 85 built on 8 validated signals. Confidence gates prevent acting on unreliable intelligence.

#### NEW RULE [GOV-002]

EFFECTIVE\_OPPORTUNITY = Dynamic\_Score x (ICS / 100). Dynamic Score 90, Confidence 25 = Effective 22.5 (LOW). Dynamic Score 75, Confidence 90 = Effective 67.5 (REAL). Effective Opportunity drives PRIORITIZATION when multiple accounts compete for limited outreach slots. WHY: Raw scores without confidence weighting lead to misallocation of resources.

#### NEW RULE [GOV-003]

Module 0 runs at 3 checkpoints: (1) After Scoring — every Dynamic Score recalculation triggers ICS recalculation, (2) Before Outreach — ICS checked before message enters execution queue, if dropped below 40 since generation = BLOCK, (3) Weekly Governance Sweep — recalculate ICS for ALL active accounts, surface 20+ point degradations. WHY: Intelligence quality can change at any time. Continuous monitoring prevents stale confidence.

### Intelligence Confidence Score — 6 Dimensions

#### NEW RULE [ICS-CALC-001]

ICS (0-100) calculated from 6 weighted dimensions: Signal Diversity 20%, Signal Recency 15%, Data Completeness 20%, Contact Coverage 15%, Verification Level 15%, Source Reliability 15%. WHY: Intelligence reliability is multi-dimensional. Strong in one area doesn't compensate for weakness in another.

#### NEW RULE [ICS-DIV-001]

Signal Diversity scoring: 0 sources = 0pts. 1 source = 20pts (single source = unreliable). 2 sources = 50pts. 3 sources = 75pts. 4+ sources = 100pts. WHY: Multi-source triangulation is fundamentally more reliable than single-source intelligence.

#### NEW RULE [ICS-REC-001]

Signal Recency scoring: within 7 days = 100pts. 8-21 days = 70pts. 22-45 days = 40pts. 46-90 days = 15pts. No signal or 90+ days = 0pts. WHY: Old intelligence is unreliable. A bank's priorities can shift in weeks.

#### NEW RULE [ICS-COMP-001]

Data Completeness checklist (each item adds points): Company name+segment+country: +10. AI account summary: +15. Digital maturity assessed: +10. Open banking readiness: +10. Strategic initiatives ( $\geq 2$ ): +15. Technology stack known: +10. Procurement complexity: +10. Competitive landscape: +10. Recent news within 30 days: +10. Total: 100. WHY: Every missing data point is a gap the AI has to guess around.

#### NEW RULE [ICS-CONTACT-001]

Contact Coverage: 0 contacts = 0pts. 1 = 15. 2 = 30. 3 = 50. 4-5 spanning 2+ departments = 75. 6+ spanning 3+ departments including C-level = 100. WHY: Enterprise deals require multi-threaded engagement. Single contact = single point of failure.

#### NEW RULE [ICS-VERIF-001]

Verification from: verified emails (up to 40pts), signals from high-reliability sources (up to 30pts), enrichment from premium sources (up to 30pts). Formula: (verified\_email% x 0.4 + verified\_signal% x 0.3 + premium\_enrichment% x 0.3) x 100. WHY: Unverified data is unreliable data.

#### NEW RULE [ICS-SOURCE-001]

Source reliability ratings: SAMA Official 0.95, established news 0.85, Google News general 0.70, LinkedIn company page 0.75, LinkedIn personal 0.60, funding DBs 0.80, verified manual BD 0.85, unverified rumor 0.40. Account ICS Source

Reliability = average reliability across all signals x 100. WHY: Not all sources are equally trustworthy.

**NEW RULE [ICS-DECAY-001]**

ICS decays by 2 points per week after last enrichment or signal ingestion if no new data arrives. WHY: Stale confidence is false confidence. Even if nothing has been contradicted, understanding degrades over time.

**NEW RULE [ICS-DECAY-002]**

ICS can only INCREASE through: (a) new signal ingestion, (b) enrichment refresh, (c) engagement events (reply validates understanding), (d) manual human verification. WHY: Confidence must be EARNED through evidence, not assumed.

# PRINCIPLE 2 — ENTERPRISE DECISION SYSTEM ARCHITECTURE

Enterprise technology purchases are not account decisions, contact decisions, or even committee decisions. They are consensus-building processes involving multiple stakeholders with varying levels of influence, authority, risk exposure, incentives, and political power, progressing through identifiable buying journey stages. The ABM Engine models organizations as dynamic decision systems. This section contains all 139 rules.

## THE 6 BUSINESS LAWS

- Law 1: Revenue is booked against accounts, not contacts.
- Law 2: Enterprise purchases are multi-stakeholder decisions.
- Law 3: The customer experiences one vendor, not multiple campaigns.
- Law 4: Buying signals originate at the organizational level.
- Law 5: Purchase probability is an account property, not a contact property.
- Law 6: Enterprise complexity collapses poorly into lead-centric systems.

## 2A-2D. Core Rules (20 Rules — Cross-Referenced from Principle 1)

Rules ACCT-COORD-001 through 006, HUMAN-AUTO-001 through 004, TIMING-WIN-001 through 002, TIMING-VOL-001 through 003, and REASON-CHAIN-001 through 004 are documented in the Principle 1 section above as they were discovered during the initial 5-Whys pass across all principles. Total: 20 rules.

## 2E. Account Identity & Boundaries (7 Rules)

### NEW RULE [ACCT-CORE-001]

10-behavior Account-Centric Matrix: (1) Scoring at account level, (2) Tier at account level, (3) Outreach triggered by account evaluation then contact selection, (4) Reply from any contact pauses entire account, (5) Engagement rolls up to account, (6) One CRM opportunity per account, (7) Enrich account first then contacts, (8) AI reasons about organization + role, (9) Cooldown per account, (10) Analytics roll up to account. WHY: Every integration defaults to contact-centric. These 10 behaviors must be explicitly enforced.

### NEW RULE [ACCT-IDENTITY-001]

Account = single legal entity or operationally independent business unit with its OWN CTO/IT leadership AND its OWN technology budget. If uncertain, default to SEPARATE accounts linked as related. WHY: Merging loses granularity. Separating and linking preserves both independence and coordination.

### NEW RULE [ACCT-IDENTITY-002]

Account Lifecycle Events: MERGER: new merged account, migrate all data, archive old records, pause active sequences for review. ACQUISITION: acquired stays separate, relationship changes to PARENT\_SUBSIDIARY, check if still independent procurement. SPIN-OFF: new account, copy relevant contacts, original keeps history. REBRAND: update name, add old name as alias. WHY: Each lifecycle event requires different data handling.

### NEW RULE [ACCT-IDENTITY-003]

Account Alias System: legal name, trading name, Arabic name, abbreviations, previous names, subsidiary names. Entity resolution checks ALL aliases. Fuzzy match: 85% English, 80% Arabic (transliteration variation). New aliases auto-added when unmapped signals are manually mapped. WHY: "SNB," "Saudi National Bank," "AlAhli" all refer to the same entity.

### NEW RULE [ACCT-IDENTITY-004]

Geographic Scoping: MVP = KSA only. GCC subsidiary signals attributed to KSA parent at 70% relevance weight. UAE-HQ fintech opening KSA office = new account scoped to KSA, HQ signals weighted at 70%. WHY: HQ decisions often flow to regional branches but aren't 100% applicable.

### NEW RULE [ACCT-IDENTITY-005]

Account Universe tiers: ACTIVE (max 50): Static Fit  $\geq 60$ , actively monitored, eligible for outreach. WATCH (max 200): Fit 40-59 or new, passive signal polling. ARCHIVE: Fit  $< 40$  or confirmed non-fit. WHY: API costs and human attention scale with account count. Caps ensure quality.

### NEW RULE [ACCT-IDENTITY-006]

Account Promotion: Watch->Active when P1/P2 signal + Fit  $\geq 50$ . Active->Watch when COLD for 90+ days. Active->Archive only by manual human decision. Archive->Watch by manual decision. WHY: Promotion is signal-driven. Demotion requires sustained inactivity. Archival requires human judgment.

## 2F. Buying Committee Model (6 Rules)

### NEW RULE [ACCT-COMMITTEE-001]

KSA Banking Buying Committee: 7 roles — Technology Champion (CTO/CDO, selects vendor, PRIMARY outreach), Business Owner (Head of Retail/Lending, funds project, SECONDARY), Financial Gatekeeper (CFO, approves budget, LATE STAGE), Compliance Guardian (CISO, validates security, PARALLEL), Operations Leader (COO, integration assessment, LATE STAGE), Executive Sponsor (CEO, final approval, NEVER direct unless relationship exists), Influencer (board/advisors, RELATIONSHIP only). WHY: KSA banking procurement involves these roles with different powers, concerns, and outreach timing.

### NEW RULE [ACCT-COMMITTEE-002]

Minimum Committee Coverage Before Outreach: 1 Technology Champion (REQUIRED) + 1 additional contact in DIFFERENT role (REQUIRED). Single contact total = outreach BLOCKED, flag "INSUFFICIENT\_COMMITTEE\_COVERAGE." Ideal: 3-5 contacts across Champion + Business Owner + one other. WHY: Single-threaded outreach is extremely fragile.

### NEW RULE [ACCT-COMMITTEE-003]

Role-Based Outreach Strategy: Technology Champion = technical capabilities, architecture, peer-to-peer tone. Business Owner = outcomes, ROI, consultative tone. Financial Gatekeeper = TCO, payback period, DO NOT outreach directly unless invited. Compliance Guardian = SAMA CSF, data residency, formal regulatory language. Operations Leader = integration, migration, pragmatic detail. Executive Sponsor = NEVER cold outreach, only warm introduction. WHY: Each role cares about different things.

### NEW RULE [ACCT-COMMITTEE-004]

Cross-Role Message Coherence: All messages to same account reference SAME signal, highlight SAME Decimal capability, propose SAME outcome. Only the ANGLE and PROOF POINTS differ by role. The NARRATIVE is consistent. WHY: If CTO and Head of Lending compare notes, messages should tell same story from different angles.

### NEW RULE [ACCT-COMMITTEE-005]

Blocker Detection: Contact classified as BLOCKER if: negative reply opposing initiative, enrichment shows competitor selection involvement, LinkedIn anti-change sentiment, connector flags resistance. Blocker handling: do NOT outreach directly (hardens opposition), outreach to champions who can build consensus AROUND the blocker, tag as role\_stance = BLOCKER. If ONLY contacts are blockers = "NO\_CHAMPION\_IDENTIFIED," pause outreach. WHY: Engaging blockers directly is counterproductive.

### NEW RULE [ACCT-COMMITTEE-006]

Informal Influence Mapping: Each contact gets influence\_modifier: STANDARD (matches title), ELEVATED (disproportionate influence — royal connection, CEO advisor, 15+ year tenure), REDUCED (less than title suggests — <6 months, interim, known to be leaving). Source: connector intel, BD knowledge, manual research only. ELEVATED contacts prioritized one seniority level higher. WHY: Title does not equal power in KSA banking.

## 2G. Failure Mode A: Account Misattribution (4 Rules)

### NEW RULE [FAIL-MISATTR-001]

Entity Resolution Confidence Bands:  $\geq 95\%$  auto-map. 85-94% auto-map + flag "VERIFY\_MAPPING" in daily digest. 75-84% DO NOT auto-map, UNMAPPED queue, human resolves within 24h.  $<75\%$  discard as noise. Arabic names: all thresholds drop 5%. WHY: "Saudi Investment Bank" vs "Saudi British Bank" vs "Saudi National Bank" — fuzzy matching can confuse them.

### NEW RULE [FAIL-MISATTR-002]

Multi-Entity Signals: When signal mentions 2+ accounts, create ONE record per account with shared group\_id. Signal type determined independently per account context. Partner mentions stored as metadata, not separate signals. WHY: "SNB and Riyadh Bank announce joint initiative" creates two signals, one per bank.

### NEW RULE [FAIL-MISATTR-003]

Misattribution Recovery: Re-map to correct account, recalculate BOTH accounts, check if outreach referenced the signal — if message said "your digital initiative" and it was actually the other bank's initiative = reputation-critical error, immediate human intervention. Log as ENTITY\_RESOLUTION\_ERROR, update aliases. WHY: Sending SNB's initiative to Riyadh Bank's CTO is permanently trust-destroying.

### NEW RULE [FAIL-MISATTR-004]

Pre-Outreach Entity Verification: QC CHECK ZERO (before all other QC checks): company name in message matches account name, signal referenced belongs to this account, no MULTI\_ENTITY flags. Fail = QC REJECTS with "ENTITY\_VERIFICATION\_FAILED." Hard block, no override without human confirmation. WHY: This is the most expensive possible error.

## 2H. Failure Mode B: Account Scope Creep (3 Rules)

### NEW RULE [FAIL-SCOPE-001]

Account Relevance Scope: Every account has defined relevance\_scope — business divisions Decimal is relevant to. Example: SNB = ["Retail Banking", "SME Lending", "Digital Banking", "Open Banking"]. Out-of-scope signals stored but EXCLUDED from scoring. WHY: SNB's insurance technology investment shouldn't inflate scoring for Decimal's lending pitch.

### NEW RULE [FAIL-SCOPE-002]

Contact Relevance Filter: Only contacts in scope divisions join active buying committee. "Head of Treasury Technology" at a retail-banking-scoped account = stored but OUT\_OF\_SCOPE for outreach. Exception: C-suite always in scope. WHY: Treasury technology contacts receiving lending platform outreach is irrelevant and unprofessional.

### NEW RULE [FAIL-SCOPE-003]

Scope Expansion Protocol: Changed only through: (a) manual update with documented reason, (b) product launch batch-update for all applicable accounts. Changes logged, trigger: re-evaluation of OUT\_OF\_SCOPE signals/contacts, score recalculation. WHY: Scope expansion is strategic, not automatic.

## 2I. Failure Mode C: Account Owner Dependency (3 Rules)

### NEW RULE [FAIL-OWNER-001]

Owner Load Limits: Max 10 HOT accounts per owner (require active management). Max 20 WARM. Owner at capacity + new HOT account = assign to next available. All owners at capacity = "CAPACITY\_OVERFLOW" alert, max 48h wait for HOT accounts. WHY: Overloaded owners become bottlenecks across all their accounts.

### NEW RULE [FAIL-OWNER-002]

Owner Transition Protocol: Owner leaves/reassigned → 24h TRANSITION\_HOLD (no new outreach, active sequences continue). Leadership reassigns within 24h based on expertise + load + relationship continuity. New owner gets Transition Brief per account. ENGAGED contacts flagged: "ACTIVE CONVERSATION — review immediately." WHY: Orphaned accounts with active conversations lose prospects.

### NEW RULE [FAIL-OWNER-003]

Owner Override Rules: CAN: delay outreach up to 14 days with reason, reprioritize contacts, edit messages, add manual signals. CANNOT: permanently suppress HOT account without leadership approval, change scoring formula, override QC rejections, delete records. All overrides logged with type, reason, duration, approved\_by. WHY: Owners need flexibility

but not unchecked power.

## 2J. Failure Mode D: Account Fatigue (4 Rules)

### NEW RULE [FAIL-FATIGUE-001]

Account Fatigue Score = (completed sequences with no positive reply) x 10 over rolling 12 months. 0-20: normal. 30-40: CAUTION, next outreach requires owner justification. 50+: FATIGUED, 180-day reset, re-engagement only through different channel or connector introduction. Score resets to 0 only after successful engagement. WHY: Repeated unsuccessful outreach annoys prospects and damages reputation.

### NEW RULE [FAIL-FATIGUE-002]

Contact Fatigue: Max 3 lifetime sequences per contact. After 3 with no positive reply = "OUTREACH\_EXHAUSTED," permanently removed from outreach pool. Exception: contact initiates contact with Decimal (inbound) = fatigue cleared, one new sequence allowed. WHY: Enterprise professionals talk. A 4th campaign will create active anti-Decimal sentiment.

### NEW RULE [FAIL-FATIGUE-003]

Outreach Freshness Requirement: New sequence requires at least ONE of: (a) NEW signal since last sequence, (b) DIFFERENT contact targeted, (c) DIFFERENT outreach angle (AI confirms substantially different), (d) connector warm introduction. None met = sequence blocked. WHY: "We have no new reason to reach out" means don't reach out.

### NEW RULE [FAIL-FATIGUE-004]

Nurture Fatigue: WARM accounts max 1 nurture touch/month. 6 consecutive zero-engagement touches = "NURTURE\_EXHAUSTED," removed from nurture. Re-enters only if promoted to HOT then back to WARM. WHY: Monthly emails to someone who never opens is spam with extra steps.

## 2K. Failure Mode E: Account Data Decay (3 Rules)

### NEW RULE [FAIL-DECAY-001]

Data Decay Rates: Contact role/title: 12-18 months. Email: 6-12 months (re-verify before each sequence). Strategic priorities: 3-6 months. Digital maturity: 6-12 months. Technology stack: 6-12 months. Buying committee composition: 3-6 months. Competitor landscape: 3-6 months. WHY: KSA banking executives change roles every 1-3 years. Data without refresh becomes fiction.

### NEW RULE [FAIL-DECAY-002]

Pre-Sequence Data Validation: Before launching ANY new sequence: (a) verify contact still holds same role (LinkedIn check), role changed = STOP + re-enrich, left company = DISQUALIFIED + find replacement, (b) re-verify email, INVALID = LinkedIn-only, (c) referenced signal not contradicted by newer info. WHY: "Pre-flight check" takes minutes but prevents messaging people who no longer work there.

### NEW RULE [FAIL-DECAY-003]

Data Staleness Threshold: If most recent enrichment >120 days AND no new signal in 60 days: ICS Data Completeness decays to 50%, Verification decays to 40%. Combined effect: ICS drops significantly, potentially triggering GOV-001 investigate-only gate. WHY: System says "we used to know about this account, but our knowledge is too old to trust."

## 2L. Reply-Based Account Pause Logic (4 Rules)

### NEW RULE [ACCT-PAUSE-001]

Pause depends on reply type: POSITIVE (let's talk) = full account pause. REFERRAL (talk to [Name]) = pause this contact, redirect to referred person, continue others. NEGATIVE-PERSONAL (I'm not interested) = pause this contact, continue others unless reply says "our COMPANY isn't interested." NEGATIVE-ORGANIZATIONAL (we chose a vendor/no budget) = full pause + human review. AUTO-REPLY = no pause, resume after return. NEUTRAL (let me check) = pause this contact temporarily, slow others 50%. WHY: Blanket pause for every auto-reply freezes the pipeline unnecessarily.

### NEW RULE [ACCT-PAUSE-002]

When system decides partial pause (not full): decision logged, account\_owner notified, 4-hour override window. No override within 4h = decision stands. WHY: Nuanced pause decisions need human oversight without requiring human initiation.

### NEW RULE [ACCT-PAUSE-003]

Pause Duration Limits: Day 7: reminder to account\_owner. Day 14: escalate to manager. Day 21: forced decision — (a) "still in conversation" + reset timer, (b) "stalled" + revert to HOT + re-enable others, (c) "dead" + DORMANT. WHY: Prevents "engaged zombie" accounts sitting paused forever because a human dropped the ball.

### NEW RULE [ACCT-PAUSE-004]

Multi-Threading Phases: Pre-engagement: automated multi-thread (up to 3 contacts, staggered). After first positive reply: single-thread through responder. After successful meeting: champion-guided multi-threading (champion introduces other stakeholders). Post-engagement multi-threading is NEVER automated. WHY: Pre-engagement is about finding doors. Post-engagement is about walking through the right one.

## 2M. Business Law Exceptions (12 Rules)

### NEW RULE [LAW1-EXCEPTION-001]

Contact Migration: When contact changes companies: update to new account. At OLD account: mark DEPARTED, check if other champions remain, if only champion = "CHAMPION\_LOST" (-30 relationship warmth). At NEW account: if in universe, create P1 "KNOWN\_CHAMPION\_ARRIVED" signal. If not in universe but Static Fit  $\geq 50$ , add to Watch. WHY: A known champion at a new bank is a GOLD signal — they already know Decimal.

### NEW RULE [LAW1-EXCEPTION-002]

Champion Departure Impact: OUTREACH\_ACTIVE = pause, find new target. ENGAGED = CRITICAL, notify owner, find replacement. MEETING\_BOOKED = reschedule with replacement. OPPORTUNITY = VERY CRITICAL, escalate to leadership, identify new decision-maker within 48h. Don't auto-outreach departed champion at new company until old account stabilized. WHY: One crisis at a time.

### NEW RULE [LAW2-EXCEPTION-001]

Decision Complexity Classification: SINGLE\_DECISION\_MAKER (<100 employees, CEO decides) = 1 contact sufficient. SMALL\_COMMITTEE (100-500, 2-3 deciders) = 2 contacts min. STANDARD\_COMMITTEE (500-5000, 5-7 deciders) = standard rules. COMPLEX\_COMMITTEE (5000+, 10+ stakeholders, procurement-driven) = 3+ contacts, human-led early. WHY: Treating a 30-person fintech like a 30,000-person bank wastes resources.

### NEW RULE [LAW2-EXCEPTION-002]

Lightweight Pipeline for SINGLE\_DECISION\_MAKER: abbreviated enrichment (CEO only), abbreviated AI chain (skip persona psychology + multi-angle strategy), shorter sequence (3 touches), binary reachability (can reach CEO or can't). WHY: Speed matters more for startups. CEO who raised funding makes vendor decisions in 30 days.

### NEW RULE [LAW3-EXCEPTION-001]

Invited Multi-Threading: When champion explicitly refers to another stakeholder, this is expansion not redirect. New contact source = "INTERNAL\_REFERRAL:[name]." Outreach references introduction. Both conversations run parallel with owner coordination. WHY: Champion gave permission. The rule adapts.

### NEW RULE [LAW4-EXCEPTION-001]

Personal vs Organizational Signal Scope: Individual-origin signals (LinkedIn post, conference quote) tagged "PERSONAL." ORGANIZATIONAL signals drive outreach to any contact. PERSONAL signals primarily to the person who generated it. DON'T tell CDO "I saw your CTO's LinkedIn post." WHY: Outing colleague's social media to another executive violates internal politics.

#### NEW RULE [LAW4-EXCEPTION-002]

2+ personal signals on same topic from different individuals within 30 days = auto-upgrade to ORGANIZATIONAL. WHY: Multiple people independently signaling = organizational-level activity.

#### NEW RULE [LAW5-EXCEPTION-001]

Contact Engagement Heatmap: Per-contact engagement breakdown maintained alongside account-level score. Shows which contacts most responsive. Feeds human strategy and persona performance analytics. Does NOT independently trigger state changes. WHY: Contact data INFORMS humans but doesn't drive system actions.

#### NEW RULE [LAW5-EXCEPTION-002]

Contact Velocity Alert: Single contact with rapidly escalating engagement (open -> click -> website -> reply in 72h) creates CONTACT\_VELOCITY\_ALERT for account\_owner. Does NOT change account score/state. WHY: Operational signal for human to prioritize.

#### NEW RULE [LAW6-EXCEPTION-001]

Contact-Focal Moments: Temporary zoom-in events when one contact becomes primary unit: meeting booked (AI brief focuses on this person), referral received (outreach crafted for referred person), connector introduction (messaging optimized for this person), procurement RFP (response formatted for procurement contact). Temporary, not architectural. WHY: Strategy is account-level. Execution has moments when one person is the game.

## 2N. Three-Score Architecture (2 Rules)

#### NEW RULE [THREESCORE-001]

Three independent scores: (1) STATIC FIT SCORE (0-100): Is this a good account for Decimal? ICP match. Moves slowly. (2) DYNAMIC INTENT SCORE (0-100): Is this account likely to buy NOW? Signal-driven. Moves frequently. (3) INTELLIGENCE CONFIDENCE SCORE (0-100): How much do we trust our understanding? Evidence-based. Decays without refresh. FIT = where to look. INTENT = when to act. CONFIDENCE = how much to trust.

#### NEW RULE [THREESCORE-002]

Three-Score Decision Matrix: HIGH/HIGH/HIGH = ideal target, maximum priority. HIGH/HIGH/LOW = investigate urgently (exciting but unverifiable, emergency enrichment). HIGH/LOW/HIGH = monitor closely (great fit, understand well, no buying signals, ready to act). HIGH/LOW/LOW = enrich and wait. LOW/HIGH/HIGH = opportunistic (evaluate niche fit). LOW/HIGH/LOW = ignore. LOW/LOW/ANY = archive. WHY: This prevents the two critical errors: acting on bad intelligence, and ignoring good intelligence.

## 2O. Layer 1: Consensus Formation Model (5 Rules)

### NEW RULE [CONSENSUS-001]

Stakeholder Position Tracking: CHAMPION (+3 x influence), SUPPORTIVE (+1 x influence), NEUTRAL (0), UNKNOWN (-0.5 x estimated influence — penalizes blind spots), RESISTANT (-1 x influence), OPPOSED (-3 x influence). WHY: The engine must know not just WHO exists but WHERE they stand.

### NEW RULE [CONSENSUS-002]

Consensus Score Calculation: Influence weights by role — CEO 30, CTO/CDO 25, Business Owner 20, Compliance/CISO 15, Procurement 10, Operations 10 (modified by ELEVATED/REDUCED). Sum weighted positions, normalize to 0-100 (0 = all opposed, 50 = balanced/unknown, 100 = all championing). WHY: Quantifies organizational alignment, not just individual interest.

### NEW RULE [CONSENSUS-003]

Consensus-Gated Actions: 75-100 STRONG = accelerate, offer pilot/pricing. 50-74 EMERGING = identify and convert uncommitted stakeholders. 30-49 WEAK = HIGH RISK of stalling, help champion build internal case. 10-29 FRAGMENTED = re-evaluate entry point. 0-9 BLOCKED = pause outreach, relationship-building only. WHY: Different consensus levels require fundamentally different strategies.

### NEW RULE [CONSENSUS-004]

Consensus Confidence:  $\geq 70\%$  known positions = HIGH confidence in score. 40-69% = MODERATE (directional, not definitive).  $<40\%$  = LOW (unreliable, primary action: discover more stakeholders). Display score AND confidence together. WHY: Consensus 80 with LOW confidence is different from 80 with HIGH.

### NEW RULE [CONSENSUS-005]

Consensus Change Alerts: Crossing DOWN from EMERGING to WEAK = alert owner. Crossing UP from WEAK to EMERGING = alert owner to accelerate. ANY stakeholder moving to OPPOSED = immediate alert regardless of overall score. WHY: Early warning on consensus degradation prevents surprise deal collapse.

## 2P. Layer 2: Champion Strength Model (4 Rules)

### NEW RULE [CHAMPION-001]

Champion Strength Score: 5 dimensions — Budget Authority 25% (DIRECT\_CONTROL=100, INFLUENCE=60, REQUEST\_ONLY=30, NONE=0), Organizational Seniority 20% (C\_SUITE=100 to MANAGER=25), Initiative Ownership 20% (NAMED\_OWNER=100 to UNRELATED=0), Internal Credibility 20% (tenure + track record + ELEVATED modifier), Relationship with Decimal 15% (MET\_IN\_PERSON=100 to NO\_ENGAGEMENT=0). STRONG 71-100, MODERATE 41-70, WEAK 0-40. WHY: A Director who loves Decimal but has no budget authority is very different from a CTO who controls \$10M.

### NEW RULE [CHAMPION-002]

Champion-Strength Strategy: STRONG = direct deal acceleration (pricing, pilot, implementation timeline). MODERATE = enablement (provide materials champion can share internally). WEAK = bridge (use as intelligence source and connection broker, don't pitch — navigate to stronger contact). WHY: Investing heavily in a weak champion consumes resources without advancing the deal.

### NEW RULE [CHAMPION-003]

Champion Strength Monitoring: Recalculated when role/title changes, new internal structure intelligence, champion references their authority level, engagement pattern changes. Strength drops below 40 from above = "CHAMPION\_WEAKENING" alert. WHY: Champions can lose power through reorgs, initiative cancellation, or political shifts.

### NEW RULE [CHAMPION-004]

Multi-Champion: Account champion strength = HIGHEST individual score. Second champion adds +15 consensus bonus. Third adds +10. Cross-level champions (CTO + Director) more valuable than same-level (two Directors). Single champion with strength 40-70 = "SINGLE\_POINT\_OF\_CHAMPION\_FAILURE." WHY: Multi-champion dramatically reduces deal risk.

## 2Q. Layer 3: Anti-Champion Detection (4 Rules)

### NEW RULE [ANTICHAMP-001]

Detection signals: direct negative reply (conf 0.9), competitor promotion on LinkedIn (0.6), connector says "[Name] blocking" (0.8), selected incumbent previously (0.7), inherently conservative role (0.4 — tag **LIKELY\_CONSERVATIVE**, NOT resistant). Silence = UNKNOWN not RESISTANT. WHY: NEVER assume opposition without evidence.

#### NEW RULE [ANTICHAMP-002]

Response strategies: OPPOSED-Philosophical = route around, build case with others. OPPOSED-Competitive = competitive displacement through champion. RESISTANT-Incumbent = change management, cost of inaction. RESISTANT-Role-based = proactive objection handling, provide role-specific reassurance. WHY: Different opposition types need different approaches.

#### NEW RULE [ANTICHAMP-003]

Veto Power: CISO (security veto), Head of Procurement (commercial veto), CEO (anything), SAMA Compliance Officer (regulatory veto). VETO\_ROLE as RESISTANT/OPPOSED = "VETO\_RISK": consensus capped at 50, owner alerted, strategy shifts to addressing veto-holder concerns. Cleared only when veto-holder moves to NEUTRAL+. WHY: One powerful opponent can kill a deal with 5 supporters.

#### NEW RULE [ANTICHAMP-004]

Silent Blocker Risk: For progressing deals, check: Do we have Compliance contact? If NO = "COMPLIANCE\_BLIND\_SPOT." Procurement? "PROCUREMENT\_BLIND\_SPOT." C-Suite? "EXECUTIVE\_BLIND\_SPOT." Each is potential silent blocker. Alert owner, use champion to identify: "Who handles procurement for technology?" WHY: Unidentified blockers surface late and kill deals.

## 2R. Layer 4: Political Power Map (4 Rules)

#### NEW RULE [POLITICAL-001]

Political Intelligence Sources: connector intelligence (HIGH reliability), engagement pattern analysis (MEDIUM — Director response triggers CTO response), LinkedIn relationship mapping (LOW-MEDIUM — former colleagues), conference/event intelligence (HIGH — CEO introduces VP as "driving our digital strategy"), board/advisory relationships (HIGH). Always HUMAN-SOURCED and MANUALLY ENTERED. Never auto-generated. WHY: Getting politics wrong is worse than not knowing.

#### NEW RULE [POLITICAL-002]

EFFECTIVE POWER = (Formal Authority x 0.4) + (Informal Influence x 0.6). 60% weight on informal because KSA banking culture values relationships and trust networks over org charts. Replaces title-based seniority in: contact priority, champion strength calculation, consensus weighting. WHY: The person the CEO trusts IS the most powerful decision-maker regardless of title.

#### NEW RULE [POLITICAL-003]

Political Shift Detection: (a) reorg announced = ALL political scores STALE, re-enrich, (b) new C-suite = existing political relationships disrupted, (c) champion initiative cancelled = their political capital drops, (d) champion promoted = power INCREASES, (e) champion moved to different department = relevance DECREASES even if power unchanged. Each triggers consensus + champion recalculation. WHY: Power is dynamic, not static.

#### NEW RULE [POLITICAL-004]

Connector Political Value: KPMG -> CEO Al-Sadhan = 95 (firm named after him). Mastercard Board -> CEO = 85. Tarabut CEO -> Bajbair = 80 (confirmed photo). ITC -> Al-Bloushi = 75 (12-year relationship). Backbase -> Ghandour = 60. LinkedIn Direct -> Rasha = 55. Connector path with weight >= 70 = RECOMMENDED connector introduction over cold outreach. WHY: High-value connector paths dramatically increase meeting probability.

## 2S. Layer 5: Buying Journey Stage Model (4 Rules)

#### NEW RULE [JOURNEY-001]

Buying Stage Inference: 9 stages — UNAWARE (no signals), AWARE (general announcements), EXPLORING (conferences, whitepapers, relevant hiring), DEFINING (RFP prep, architecture hiring), EVALUATING (RFP published, vendor meetings), SHORTLISTING (narrowed to 2-3), PROCUREMENT (formal process), NEGOTIATION (terms), CLOSED. Stage inferred from signal COMBINATIONS, not individual signals. Probabilistic: most likely stage + confidence. WHY: Same signal can indicate different stages depending on surrounding context.

#### NEW RULE [JOURNEY-002]

Stage-Appropriate Outreach: UNAWARE = thought leadership only, 1 touch, no meeting ask. AWARE = signal-triggered insight, standard sequence. EXPLORING = case studies, category leadership. DEFINING = architecture briefs, influence

requirements. EVALUATING = competitive comparison, POC proposal. SHORTLISTING = address final objections, executive involvement. PROCUREMENT = compliance docs, respond rapidly. NEGOTIATION = human only, no automation. WHY: Sending POC proposals to UNAWARE accounts is premature. Sending thought leadership to EVALUATING accounts is too late.

#### **NEW RULE [JOURNEY-003]**

Stage as Score Modifier: Stage bonus on Effective Opportunity — EVALUATING/SHORTLISTING x1.3, DEFINING x1.1, EXPLORING x1.0, AWARE x0.9, UNAWARE x0.7. Two accounts with identical scores correctly prioritized when one is evaluating and the other barely aware. WHY: Active buyer = higher near-term conversion = higher effective opportunity.

#### **NEW RULE [JOURNEY-004]**

Stage Regression: EVALUATING -> EXPLORING (budget freeze, champion departed). DEFINING -> AWARE (requirements abandoned, reorg). Any -> UNAWARE (major crisis, CEO change, merger). SHORTLISTING -> EVALUATING (shortlist rejected = OPPORTUNITY for Decimal if wasn't on original list, treat as P1 "SHORTLIST\_REOPENED"). Regression reduces stage bonus but doesn't directly reduce Dynamic Score. WHY: Signals that raised the score are still real — intent is DEFERRED, not gone.

## 2T. Layer 6: Budget Architecture (5 Rules)

### NEW RULE [BUDGET-001]

Budget Status: UNKNOWN (default), UNFUNDED (want but no budget), SEEKING\_BUDGET (building business case), BUDGET\_APPROVED (money exists), BUDGET\_ALLOCATED (vendor evaluation funded), BUDGET\_EXHAUSTED (spent on competing priority/competitor). WHY: "Interested" is not "funded." The real buying signal is budget confirmation.

### NEW RULE [BUDGET-002]

Budget Impact: UNFUNDED = shift to ROI justification messaging, -10 Dynamic Score, timeline 6-12mo. SEEKING = provide ROI ammunition, no penalty, timeline 3-6mo. APPROVED = accelerate, +15 Dynamic Score, timeline 1-6mo. ALLOCATED = maximum urgency, +25 Dynamic Score, timeline 1-3mo. EXHAUSTED = pause, -25 Dynamic Score, wait for next cycle. WHY: Budget status has more predictive value than email engagement.

### NEW RULE [BUDGET-003]

KSA Budget Cycle: Q4 Oct-Dec = budget planning. Q1 Jan-Mar = budgets approved, vendor evals start. Q2 Apr-Jun = implementation decisions. Q3 Jul-Sep = mid-year reviews, emergency regulatory budgets. GOLDEN PERIOD: Q4 (influence next year's budget) and Q1 (catch fresh budgets). October messaging: "As you plan 2027..." February: "Now that budgets are set..." WHY: Timing outreach to budget cycle dramatically increases receptivity.

### NEW RULE [BUDGET-004]

Budget-Gated Pipeline: Opportunity can only reach OPPORTUNITY state if budget >= SEEKING. UNFUNDED/UNKNOWN = "UNQUALIFIED\_OPPORTUNITY" with "BUDGET\_NOT\_CONFIRMED" flag. Owner must confirm budget status during/after first meeting. WHY: Pipeline with unfunded opportunities is fiction.

### NEW RULE [BUDGET-005]

Budget as Effective Opportunity Modifier: ALLOCATED x1.4, APPROVED x1.2, SEEKING x1.0, UNKNOWN x0.8, UNFUNDED x0.5, EXHAUSTED x0.2. Full formula:  $EFFECTIVE\_OPPORTUNITY = Dynamic\_Score \times (ICS/100) \times Stage\_Bonus \times Budget\_Modifier$ . WHY: Account with score 90, ICS 80, EVALUATING (x1.3), UNFUNDED (x0.5) = 46.8 effective. Despite looking hot, money isn't there.

## 2U. Layer 7: Initiative Criticality (3 Rules)

### NEW RULE [INITIATIVE-001]

5 criticality levels: REGULATORY\_MANDATORY (SAMA mandate, failure = penalties — compressed cycle, emergency budget, first-mover advantage). STRATEGIC\_MANDATORY (board-approved, CEO KPI — moderate compression, pre-approved budget). REVENUE\_CRITICAL (impacts revenue — standard cycle, ROI justification required). EFFICIENCY\_IMPROVEMENT (cost reduction — long cycle, discretionary budget). NICE\_TO\_HAVE (innovation experiment — very long/indefinite, first to be cut). WHY: A SAMA mandate and a website redesign both generate signals but are fundamentally different opportunities.

### NEW RULE [INITIATIVE-002]

Criticality Impact: REGULATORY\_MANDATORY increases Regulatory Pressure dimension weight from 30% to 40%. STRATEGIC\_MANDATORY +10 bonus. REVENUE\_CRITICAL no modifier. EFFICIENCY -5. NICE\_TO\_HAVE -15. AI Strategy Agent uses criticality for framing: regulatory-urgency, ROI, cost-savings respectively. WHY: Criticality determines both scoring weight and messaging approach.

### NEW RULE [INITIATIVE-003]

Criticality Inference: REGULATORY = auto-classified when signal\_type=REGULATORY + SAMA deadline confirmed. STRATEGIC = CEO endorsement + board approval + Vision 2030 alignment (2+ corroborating points). REVENUE = revenue targets, market share, competitive pressure (1+ point). EFFICIENCY = default for automation/cost initiatives unless escalated. NICE\_TO\_HAVE = "pilot," "experiment," "innovation lab" without budget/deadline. Uncertain = default EFFICIENCY. WHY: Classification rules prevent everything from being called "strategic."

## 2V. Layer 8: Project Maturity (3 Rules)

### NEW RULE [MATURITY-001]

9-stage maturity: IDEA (10) = someone mentioned it. DISCUSSION (20) = internal conversations. SPONSOR\_IDENTIFIED (35) = executive owns it. BUDGET\_REQUESTED (45) = business case submitted. BUDGET\_APPROVED (60) = money exists. REQUIREMENTS\_DEFINED (75) = they know what they want. VENDOR\_EVALUATION (85) = formal evaluation. PROCUREMENT (90) = commercial process. IMPLEMENTATION

(100) = vendor selected. WHY: "Digital Transformation Announced" at IDEA stage is completely different from the same words at VENDOR\_EVALUATION stage.

#### NEW RULE [MATURITY-002]

Maturity as Pipeline Reality: <35 (IDEA/DISCUSSION) = NOT pipeline, stays as intelligence in ABM engine, NOT in CRM as opportunity. 35-59 = early pipeline, CRM Stage 1, forecast 5-10%. 60-84 = active pipeline, Stage 2, forecast 15-30%. 85+ = committed pipeline, Stage 3-4, forecast 30-70%. WHY: Counting PowerPoint initiatives as real pipeline is the #1 enterprise forecasting failure.

#### NEW RULE [MATURITY-003]

Maturity Velocity & Stall: Expected progression: each stage within 30-90 days. No advancement in 90 days = "MATURITY\_STALLED" (budget rejected, sponsor lost interest, competing priority, quietly abandoned). Owner investigates. Dead initiative = retract signals, recalculate. Delayed = update urgency, maintain monitoring. Maturity can regress per JOURNEY-004 rules. WHY: Stalled maturity is the strongest predictor of a deal that will never close.

## 2W. Layer 9: Internal Urgency Model (3 Rules)

#### NEW RULE [URGENCY-001]

4 urgency horizons: IMMEDIATE (<90 days) = regulatory deadline, emergency procurement, competitive loss risk. NEAR\_TERM (3-6mo) = active evaluation, funded initiative. MID\_TERM (6-12mo) = budget cycle next year, early-stage. LONG\_TERM (>12mo) = visionary, unfunded, market observation. WHY: Same signal type can have completely different urgency depending on deadline and organizational pressure.

#### NEW RULE [URGENCY-002]

Urgency-Driven Sequence Timing: IMMEDIATE = compress to 7 days (Day 1, 2, 4, 7), LinkedIn Day 1 parallel. NEAR\_TERM = standard 14-day. MID\_TERM = extend to 21-day (more spacing). LONG\_TERM = no sequence, single touch every 60 days. WHY: 90-day window means 14-day sequence consumes 15% of decision window. 12-month horizon means aggressive outreach creates premature rejection.

#### NEW RULE [URGENCY-003]

Urgency Inference: IMMEDIATE = SAMA deadline within 90 days, contact states date, competitor contract expiring within 90 days, board mandate with quarterly deadline. NEAR\_TERM = active RFP with timeline, current-year budget approved, new CTO with 6-month mandate. MID\_TERM = initiative without deadline, next-year budget planning, hiring for 6+ month roles. LONG\_TERM = "future roadmap," innovation lab, no timeline signals. WHY: Urgency must be inferred from evidence, not assumed.

## 2X. Layer 10: Vendor Lock-In Analysis (3 Rules)

#### NEW RULE [COMPETE-001]

Vendor Entrenchment Assessment: Incumbent Identity (named vendor), Contract Lock-In (LOCKED multi-year=30, EXPIRING=10, NONE=0), Integration Depth (DEEP=30, MODERATE=15, LIGHT=5), Switching Cost (HIGH >\$2M=25, MEDIUM=15, LOW=5), Political Entrenchment (powerful internal advocate for incumbent YES=15, SOME=8, NO=0). Total 0-100. WHY: Need exists + buying possible does NOT mean Decimal can win if incumbent is deeply entrenched.

#### NEW RULE [COMPETE-002]

Entrenchment Strategy: 0-25 LOW = open field, standard approach. 26-50 MODERATE = complementary positioning ("Decimal adds origination ON TOP of your [Incumbent]"). 51-75 HIGH = difficult, look for cracks (contract expiry, incumbent failure), only pursue if IMMEDIATE/NEAR\_TERM urgency + criticality >= REVENUE\_CRITICAL. 76-100 FORTRESS = don't pursue primary deal, explore wedge (origination alongside locked core), wait for contract expiry. WHY: Different entrenchment levels require fundamentally different go-to-market strategies.

#### NEW RULE [COMPETE-003]

Entrenchment Modifier on Effective Opportunity:  $(100 - \text{Entrenchment\_Score}) / 100$ . FORTRESS (80) =  $\times 0.20$ . Full formula now:  $\text{EFFECTIVE\_OPPORTUNITY} = \text{Dynamic\_Score} \times (\text{ICS}/100) \times \text{Stage\_Bonus} \times \text{Budget\_Modifier} \times \text{Entrenchment\_Modifier}$ . WHY: Prevents wasting premium outreach on unwinnable accounts.

## 2Y. Layer 11: Procurement Readiness (2 Rules)

#### NEW RULE [PROCURE-001]

8-stage procurement: NO\_PROCESS, INFORMAL\_EVALUATION, VENDOR\_DISCOVERY, RFP\_PREPARATION, RFP\_ACTIVE, SHORTLISTING, CONTRACTING, APPROVAL. WHY: Deals die in procurement. Interest means nothing if procurement isn't activated.

#### NEW RULE [PROCURE-002]

Procurement Gap Detection: Journey stage >= EVALUATING but procurement = NO\_PROCESS/INFORMAL = "PROCUREMENT\_GAP" flag. Champion running ahead of formal process. Alert owner: "Champion engaged but procurement not activated. Help champion engage procurement now." WHY: Mismatch between journey stage and procurement readiness = stall risk.

## 2Z. Layer 12: Relationship Network Graph (3 Rules)

#### NEW RULE [RELNET-001]

Graph Model: Nodes — DECIMAL\_EMPLOYEE, PARTNER\_CONTACT, ADVISOR, PROSPECT\_CONTACT. Edges — WORKS\_WITH, WORKED\_WITH (former colleagues), REPORTS\_TO, REFERRED\_BY, ADVISOR\_TO, BOARD\_MEMBER\_OF, ALUMNI\_OF (KFUPM/KSU networks), PARTNER\_OF. WHY: KSA banking relationships have topology. Path matters, not just warmth.

#### NEW RULE [RELNET-002]

Relationship Path Scoring: Direct 1-hop = Warmth 90. Partner-mediated 2-hop = 70. Extended 3-hop = 45. 4+ hops or no path = 10. Modified by edge type: WORKED\_WITH and REFERRED\_BY highest weight. ALUMNI\_OF and BOARD\_MEMBER\_OF medium. PARTNER\_OF standard. REPLACES simplistic relationship\_warmth field. WHY: Graph-based warmth is more accurate than flat categorical warmth.

#### NEW RULE [RELNET-003]

Path Strategy: Warmth >= 60 = RECOMMENDED connector introduction. 30-59 = optional mention of shared connection. <30 = cold outreach. NEVER fabricate or exaggerate connections. Only reference connections the prospect would recognize. WHY: Claiming a connection that doesn't exist destroys trust faster than cold outreach.

## 2AA. Layer 13: Organizational Stability (2 Rules)

### NEW RULE [ORG-001]

Stability Score (0-100): Base 100. CEO <6mo: -25. CTO <6mo: -15. Recent reorg: -20. Active layoffs: -25. Active M&A: -30. Major strategy pivot: -15. Completed events: half the deduction. WHY: Unstable organizations freeze decision-making regardless of intent signals.

### NEW RULE [ORG-002]

Stability Impact:  $\geq 70$  = normal operations. 40-69 = extend expected sales cycle +50%, AI notes instability.  $<40$  = FREEZE outreach (organization in turmoil, outreach perceived as tone-deaf). Exception: REGULATORY\_MANDATORY overrides freeze. WHY: Reaching out during mass layoffs makes Decimal look oblivious.

## 2AB. Layer 14: Consensus Momentum (3 Rules)

### NEW RULE [MOMENTUM-001]

Consensus Velocity = change in Consensus Score over 30 days. ACCELERATING: +10pts. STEADY:  $<10$  either direction. DECELERATING: -10pts. COLLAPSING: -25pts. WHY: Direction of consensus predicts outcomes better than absolute consensus level.

### NEW RULE [MOMENTUM-002]

Momentum Actions: ACCELERATING = priority boost, allocate more resources, provide escalation materials. STEADY = maintain. DECELERATING = warning, owner investigates (champion left? blocker emerged? budget questioned?). COLLAPSING = crisis, 48h strategy meeting — fight or accept loss. WHY: Different velocities require different responses.

### NEW RULE [MOMENTUM-003]

Momentum as Predictive Signal: After 6+ months data, correlate velocity with outcomes. Hypothesis: ACCELERATING velocity predicts CLOSED\_WON better than static score. A deal going 30->60 consensus in 60 days more likely to close than 70 consensus static for 6 months. Movement = organizational energy being applied. WHY: Trend predicts better than state.

## 2AC. Layer 15: Opportunity Death Prediction (3 Rules)

### NEW RULE [RISK-001]

Opportunity Risk Register: 7 categories — CHAMPION\_DEPARTURE, BUDGET\_KILL, COMPETITOR\_DISPLACEMENT, REGULATORY\_DELAY, PROCUREMENT\_FREEZE, PRIORITY\_SHIFT, ORGANIZATIONAL\_CRISIS. Each with detection method, probability (0-100%), impact (1-5), mitigation strategy. WHY: "What could kill this deal?" is more actionable than "Will they buy?"

### NEW RULE [RISK-002]

Risk-Weighted Opportunity:  $\text{Risk\_Exposure} = \text{sum}(\text{probability} \times \text{impact})$ .  $\text{Risk\_Modifier} = \max(0.2, 1 - \text{Risk\_Exposure}/500)$ . FINAL formula:  $\text{EFFECTIVE\_OPPORTUNITY} = \text{Dynamic\_Score} \times (\text{ICS}/100) \times \text{Stage\_Bonus} \times \text{Budget\_Modifier} \times \text{Entrenchment\_Modifier} \times \text{Risk\_Modifier}$ . WHY: Three high-probability risks reduce the effective opportunity of an otherwise "hot" deal to its true fragile value.

### NEW RULE [RISK-003]

Risk Alerts: Any single risk  $>70\%$  probability = immediate alert + mitigation recommendation. Total Risk Exposure  $>250$  = "DEAL\_AT\_RISK" flag, owner + manager review within 48h. Previously mitigated risk RETURNS = "RECURRING\_RISK" escalation (systemic problem, not bad luck). WHY: Early risk detection enables proactive mitigation.

## 2AD. Trend & Prediction (2 Rules)

### NEW RULE [TREND-001]

Account Trajectory Model: 10 dimensions tracked monthly — Dynamic Intent, ICS, Consensus, Champion Strength, Budget Status, Initiative Maturity, Urgency Horizon, Organizational Stability, Procurement Readiness, Entrenchment. Each trending UP/STABLE/DOWN. Trajectory = up-count minus down-count. +5 or more = STRONG POSITIVE (accelerating). -5 or more = STRONG NEGATIVE (collapsing). WHY: Where the account is heading matters more than where it is.

### NEW RULE [TREND-002]

Predictive Assessment (post-12 months): "[Account] has [Y]% probability of entering vendor evaluation within [Z] days" based on trajectory patterns correlated with historical outcomes. MVP does NOT include prediction. But data model captures ALL 10 dimensions from Day 1 so prediction engine has training data. WHY: Transition from reactive ABM to predictive ABM requires historical data collection starting now.

## 2AE. Competitive Intelligence System (4 Rules)

### NEW RULE [COMPINTEL-001]

Competitor Tracking Registry: competitor name, target account, deal stage, outcome, product category. Maintained across ALL accounts. WHY: In a 25-bank market, every competitor move affects multiple accounts simultaneously.

### NEW RULE [COMPINTEL-002]

Competitor Move Propagation: Competitor WINS at Bank A — (a) Bank A entrenchment increases +20-30, (b) same-segment banks get competitor social proof signal, (c) banks that rejected competitor get positive Decimal validation. Competitor LOSES — (a) entrenchment drops, potential opening, (b) other banks considering competitor may have concerns. WHY: One event, three different impacts across the market.

### NEW RULE [COMPINTEL-003]

Competitive Messaging Framework: No competitor detected = lead with Decimal value, no competitive mention. Competitor pursuing same account = differentiate, NEVER name-drop in cold outreach. Competitor won different category = complementary positioning. Competitor lost at this account = validate bank's criteria. In-house solution = modernization framing, not replacement. WHY: Competitive messaging must match the specific scenario.

### NEW RULE [COMPINTEL-004]

Competitive Blind Spot: HOT account at EVALUATING+ without known competitors = "COMPETITIVE\_BLIND\_SPOT." Dangerous: could be checkbox comparison, may already have chosen. Owner must ask during first meeting: "Who else are you considering?" Info withheld = note as data point. WHY: You can't differentiate if you don't know who you're competing against.

## 2AF. Reference Effect & Social Proof (3 Rules)

### NEW RULE [REFERENCE-001]

Reference Account Strategy: Reference strength from prestige (Tier 1 bank = highest), implementation maturity (production > implementing > signed), use case match (same use case = strongest), willingness (REFERENCEABLE / CASE\_STUDY\_APPROVED / CONFIDENTIAL). NEVER reference CONFIDENTIAL customers. WHY: References are the most powerful sales tool in a 25-bank market.

### NEW RULE [REFERENCE-002]

Reference Proximity Effect: Customer win creates P2 "PEER\_ADOPTION" signal for same-segment accounts. Enables reference-based messaging. First 90 days after public reference = highest impact window. WHY: "Your peer is seeing [results] with this approach" converts better than any cold messaging.

### NEW RULE [REFERENCE-003]

Negative Reference Risk: If Decimal loses major deal or customer has implementation problems: NEGATIVE\_REFERENCE\_RISK flag for same-segment accounts. AI prepares counter-narrative. Track whether negative reference appears in prospect conversations. WHY: Bad news travels faster than good news in a small market.

## 2AG. Portfolio Strategy (3 Rules)

### NEW RULE [PORTFOLIO-001]

Portfolio Allocation: TIER A "Must Win" (5-8 accounts) = highest Effective Opportunity + strategic significance, maximum resources. TIER B "Should Win" (10-15) = high opportunity, standard resources. TIER C "Opportunistic" (15-20) = moderate, light resources. TIER D "Monitor" = remaining, automated monitoring only. Tier A never exceeds 8. WHY: More than 8 "must win" means none get adequate attention.

### NEW RULE [PORTFOLIO-002]

Portfolio Balance: Diversify across buying stage (AWARE + EXPLORING + EVALUATING + PROCUREMENT), segment (not all Islamic, not all digital), timeline (mix IMMEDIATE + NEAR\_TERM + MID\_TERM). Monthly health check for over-concentration. WHY: Concentrated portfolios are fragile to sector-specific disruptions.

### NEW RULE [PORTFOLIO-003]

Resource Reallocation: Effective Opportunity drops 30+ points in 30 days = reduce tier. Increases 30+ points = evaluate promotion. CLOSED\_WON/LOST Tier A account = immediately evaluate Tier B for promotion. Never leave Tier A slot empty. WHY: Resources must flow from losing to winning opportunities proactively.

## 2AH. Market Position Intelligence (1 Rule)

### NEW RULE [MARKET-001]

Quarterly assessment: Brand Awareness (UNKNOWN/EMERGING/RECOGNIZED/ESTABLISHED — determines credibility level in messaging), Category Perception (clear positioning or confused?), Competitive Narrative (what competitors say about Decimal), Reference Density (0 / 1-2 / 3+ KSA references), Trust Signals (SAMA CSF, ISO 27001, KSA data residency, Saudi entity). Feeds AI Agents 2 and 5. WHY: Message from unknown vendor must include credibility. Message from established player can skip it.

## 2AI. Account Network Effects (3 Rules)

### NEW RULE [NETWORK-001]

Account Influence Network: 6 connection types — SHARED\_BOARD, SHARED\_CONSULTANT, PEER\_GROUP, ALUMNI\_NETWORK, SUBSIDIARY, CONFERENCE\_CLUSTER. Each has specific influence mechanism. WHY: Banks influence each other's technology decisions through interconnected relationships.

### NEW RULE [NETWORK-002]

Network Propagation: Milestone at one account creates opportunities at connected accounts. SHARED\_BOARD = warm introduction path. PEER\_GROUP = peer adoption signal. SUBSIDIARY = "group alignment" messaging. Sequence propagation by Effective Opportunity. WHY: One win creates 3-5 warm paths. This is the most capital-efficient growth mechanism.

### NEW RULE [NETWORK-003]

Domino Account: Identify account whose adoption creates maximum network propagation. Domino Score =  $\text{sum}(\text{influence\_weight} \times \text{connected\_account\_fit})$ . Always Portfolio Tier A. Executive Decimal involvement. Willing to invest in POC at reduced margin. In current intelligence: SNB is likely the Domino Account. WHY: Winning SNB could generate 3-5 warm conversations within 90 days through network effects.

## 2AJ. Customer Intelligence & Flywheel (3 Rules)

### NEW RULE [CUSTOMER-001]

When account\_state = CUSTOMER, intelligence model shifts: track expansion signals not buying signals, measure Customer Health Score not Dynamic Intent, monitor expansion committee not buying committee, watch competitive displacement risk. WHY: Same account, completely different intelligence needs post-sale.

### NEW RULE [CUSTOMER-002]

Customer Health Score (0-100): Product Usage 25%, Satisfaction Signals 25%, Expansion Signals 20%, Relationship Depth 15%, Competitive Threat 15%. <50 = AT\_RISK (churn prevention). 50-75 = STABLE (maintain). >75 = HEALTHY (prime for expansion + reference). WHY: Customer health predicts both retention and expansion revenue.

### NEW RULE [CUSTOMER-003]

Customer-to-Pipeline Flywheel: Win -> deliver results -> customer becomes referenceable -> PEER\_ADOPTION signals for same-segment -> peer enters outreach with reference messaging -> higher reply rates -> win peer -> MORE references -> market position shifts UNKNOWN -> ESTABLISHED. Track: "How many pipeline opportunities reference a Decimal customer?" WHY: The first win doesn't just generate revenue — it generates the social proof that makes every subsequent win easier.

## 2AK. Expansion Intelligence (2 Rules)

### NEW RULE [EXPAND-001]

Expansion Opportunity Detection: 6 signal types — new department interest (CROSS\_SELL), new use case (UPSELL), usage exceeding scope (capacity expansion), adjacent initiative announced (CROSS\_SELL), regulatory change affecting new area (compliance expansion), positive internal advocacy (organic expansion). Scored with same Dynamic Intent framework but HIGHER confidence and LOWER entrenchment. WHY: Expansion at existing customer is the highest-probability, lowest-cost revenue.

### NEW RULE [EXPAND-002]

Expansion Priority: Expansion with Effective Opportunity  $\geq 50$  always ranks above new account at same score. Exception: Domino Account can override. WHY: (a) higher conversion probability, (b) lower cost of sale, (c) higher lifetime

value, (d) stronger reference.

## 2AL. Loss Intelligence (3 Rules)

### NEW RULE [LOSS-001]

Structured Loss Analysis: 5 dimensions — Loss Reason (competitor/budget/initiative cancelled/procurement/politics/timing), Competitor Analysis (who won, why), Recoverable? (future opportunity, what needs to change), Systemic Learning (pattern?), Signal Quality (were signals accurate?). WHY: Each loss teaches something. Unstructured losses teach nothing.

### NEW RULE [LOSS-002]

Loss Pattern Detection: 3+ losses with same root cause = strategic escalation. Same competitor winning = positioning gap. Same segment = product-fit gap. Same procurement stage = compliance/pricing gap. Same evaluating stage = demo/POC gap. Same despite strong champion = champion support gap. WHY: Patterns reveal systemic problems that individual fixes can't solve.

### NEW RULE [LOSS-003]

Lost Account Re-Engagement: COMPETITOR\_WON = 180-day cooldown, re-engage on competitor failure signals or contract expiry. BUDGET\_KILLED = wait for next cycle (6-12mo), re-engage on new budget or regulatory mandate. INITIATIVE\_CANCELLED = wait for new initiative (6-24mo). TIMING = respect stated timeline + set calendar reminder. WHY: Each loss reason has a different recovery timeline and trigger.

## 2AM. Temporal Patterns & Seasonality (3 Rules)

### NEW RULE [TEMPORAL-001]

KSA Banking Annual Calendar: Jan-Feb = HIGHEST OPPORTUNITY (fresh budgets, new plans). Mar-Apr = active pursuit (evaluations, procurement). May-Jun = Ramadan (business slows, shorter hours). Jun-Jul = Eid + summer (executives travel). Aug-Sep = SECOND OPPORTUNITY (post-summer, regulatory deadlines). Oct-Nov = budget planning (plant seeds for next year). Nov-Dec = Eid + year-end (mixed). WHY: KSA has strong seasonal patterns that affect receptivity.

### NEW RULE [TEMPORAL-002]

Seasonal Calibration: Jan-Feb = increase daily cap +50%. Ramadan = reduce to 50% volume, 10am-2pm only, shorter messages, warm tone, no aggressive CTAs. Summer = 60% volume, extend sequence gaps +50%. Oct-Nov budget season = "plan for next year" framing. WHY: Outreach calibrated to season performs better than one-size-fits-all.

### NEW RULE [TEMPORAL-003]

Response Rate Seasonal Adjustment: Jan-Mar = standard targets. Ramadan = targets -40%. Summer = -25%. Oct-Nov = +10%. Without adjustment, analytics falsely reports "degradation" every Ramadan and "improvement" every January. WHY: Seasonal normalization prevents misleading feedback loops.

## 2AN. Deal Velocity & Pipeline Aging (3 Rules)

### NEW RULE [VELOCITY-001]

Deal Velocity: STAGE\_VELOCITY = days in each buying stage. EXPECTED\_VELOCITY = based on decision\_complexity x criticality x budget. VELOCITY\_RATIO = actual/expected. <1.0 = faster (good). >1.0 = slower. >2.0 = STALLED. WHY: How fast deals move matters as much as whether they move.

### NEW RULE [VELOCITY-002]

Pipeline Aging Alerts: <0.8x = ACCELERATING (allocate more). 0.8-1.2x = ON\_TRACK. 1.2-2.0x = SLOWING (investigate). 2.0-3.0x = STALLED (written assessment required). >3.0x = ZOMBIE (force GO/NO-GO within 7 days — commit specific restart actions or CLOSED\_LOST). WHY: Zombie deals consume attention, create false pipeline, prevent resource reallocation.

### NEW RULE [VELOCITY-003]

Pipeline Age Distribution Health: Healthy = 30% at <30 days, 40% at 30-90d, 20% at 90-180d, 10% at 180d+. Unhealthy = >30% at 180d+ (pipeline full of zombies). Monthly check. WHY: Age concentration reveals whether we're pursuing right accounts or letting dead deals linger.

# THE COMPLETE EFFECTIVE OPPORTUNITY EQUATION

## MASTER FORMULA

EFFECTIVE\_OPPORTUNITY =

Dynamic\_Score x (Intelligence\_Confidence / 100) x Stage\_Bonus x Budget\_Modifier x Entrenchment\_Modifier x Risk\_Modifier

Six multiplicative layers. Each can reduce an apparently 'hot' opportunity to its true value.

This is what separates real enterprise intelligence from a lead scoring spreadsheet.

## Account Intelligence Card — Complete View

Every account now carries:

- **Three Scores:** Static Fit, Dynamic Intent, Intelligence Confidence
- **Five Context Layers:** Budget Status, Initiative Criticality, Project Maturity, Urgency Horizon, Procurement Readiness
- **Three Political Layers:** Consensus Score + Velocity, Champion Strength, Anti-Champion/Veto Detection
- **Two Structural Layers:** Vendor Entrenchment, Organizational Stability
- **One Predictive Layer:** Account Trajectory (10-dimension trend)
- **One Output:** Effective Opportunity Score with full audit trail of every modifier

## END OF SECTION 1 — PRINCIPLES 1 & 2 COMPLETE
