

ABM ENGINE — BUSINESS LOGIC BIBLE

MASTER COVER & INDEX | Complete Deliverable Set | Decimal Technologies | June 2026

WHAT THIS IS

The complete, build-ready specification for Decimal's AI-native ABM engine for KSA banking. 1,065 rules across 19 sections, divided into three additive maturity tiers, with all conflicts resolved and three engineering artifacts that make it directly implementable. Read the documents in the order below.

Scope is locked to the current ABM engine. The moat / capital-layer expansion (Relationship, Reputation, Network, Knowledge, Market Coverage capital) is intentionally out of scope — it is Generation 2+ work that builds on the Tier-6 Strategic Memory entities already present here.

THE DELIVERABLE SET — READ IN THIS ORDER

#	Document	What it is	When to use it
0	This Cover & Index	Map of the whole set	First. Orientation.
1	Document 1 — MVP Engine (462 rules)	The lean engine that proves one outbound loop	Build first (Stages 1-7)
2	Document 2 — Production Engine (866 rules)	MVP + dual-scoring, multi-channel, EPIS, learning loops	Build second (Stages 8-10)
3	Document 3 — Perfect Engine (1,065 rules)	Everything + cognition, autonomy A3-A5, antifragility	Build third (Stages 11-12)
4	Coherence Audit (1,058-rule scan)	9 conflicts found + 7 reconciliation rules	Read before building. Already resolved.
5	Artifact 1 — Modifier Lookup Table	Every scoring multiplier, exact values	When building the scoring engine (Stage 3)
6	Artifact 2 — API Contracts (12 endpoints)	Request/response schemas, FastAPI	When building any service
7	Artifact 3 — Build Order + Tests	12 stages, dependency-ordered, with pass/fail tests	Test execution plan. Run top to bottom.

RULE DISTRIBUTION

Tier	Rules	Cumulative	Delivers
MVP	462	462	Signal>score>enrich>AI>review>send>track>handoff>CRM
Production	+404	866	Opportunity dual-score, LinkedIn, EPIS, A0-A2, learning loops
Perfect	+199	1,065	25 Meta-Principles, A3-A5, cognition M13-M19, antifragility

THE FIVE FACTS A NEW READER NEEDS

ENGINE AT A GLANCE

- Unit of selling:** Opportunity (E38). Account is the relationship container.
- Scoring spine:** Effective Opportunity = Dynamic x (ICS/100) x Stage x Budget x Entrenchment x Risk x Window; Decision Score = Effective Opportunity x (Readiness/100) / Capital Cost. (See Artifact 1 for exact modifier values.)
- Conflict resolution:** 6-tier Constraint Hierarchy — Legal > Safety > Relationship > Timing > Revenue > Optimization.
- Autonomy:** A0 (impossible) through A5 (full). MVP caps at A1. C-suite is permanently human-reviewed at every level.
- Constitution:** 25 Meta-Principles are immutable. No learning loop, override, or optimization may violate them.

Stack: n8n (routing only, zero business logic) | FastAPI (all logic) | PostgreSQL (engine source of truth) | HubSpot (deal source of truth) | Claude Sonnet + GPT | Instantly (email) | Heyreach (LinkedIn) | Apollo/Clearbit/Clay (enrichment) | Metabase (analytics).

HOW TO START THE BUILD

Open Artifact 3 (Build Order). Begin Stage 1 (data layer). For each stage, pull the relevant rules from the matching FSD document, implement, then run the stage's acceptance test plus any critical-path tests that touch it. A stage is done only when its test is green; don't start a stage until its dependencies pass. Treat Stage 3 (scoring engine) tests as non-negotiable — that's where two engineers can silently diverge, and Artifact 1 + test T-SCORE-1 (the 46.8 worked example) exist to prevent exactly that.
